All the fun of the fair: Deckhond visits the Commodore Show

London's Novotel, more noted for Japanese and American tourists, was the venue for Commodore's 5th annual show, *com evaganza*. And Commodore walebe, Henry Deckhond, put his press centre to good use and came away unscathed to file this special show report.

4

14

Butterfield on Gorboge: - part 2

Last month Jim explained in his wamatble style how garbage collection works and why it can be a slow process. Now it's time for you to put your accumulated wisdom to good use.

17

A look at adventure games:

The Commodore 64 is a particularly good machine for adventure games because of its rather large memory. We've selected a sample game for review as a preview to a regular column of hints and tips for adventures.

39

Vic Victuols: monitoring with TinyMon

It won't be news to Vic owners that their favourite machine has no language monitor. If you want one, you'll have to go out and buy one. Not quite, you could use Jim Butterfield's TinyMon, reprinted here from an early issue of Vic Computing.

30

A Bigger Basic: using the DEF FN statement

One of the most ill understood and under used features of the Basic language is the DEF FN statement. Chris Durham goes to grips with the feature of Basic in one of his occasional looks at ways to better your programming.

41

Network for the 64: Visiting Computel

One way of extending the horizons of your 64s topology into a network is Commodore together with ADP network services, is now offering CompuNet. 64 users it purports to let you access public information, send messages and do your shopping from the comfort of your armchair. Armed with 64 modems and 168 CompuNet subaccounts, Karl Dallas probes the facilities CompuNet offers.

41

45

64 Victuols: a tune for Summer

Wherever you're going on holiday this summer, there's one tune that nearly everybody will be humming. Don't be left out, singalong a summer

46

Using the 64 function keys:

The idea behind function keys is that they enable you to accomplish complex tasks with one keypress. Although your User Manual acknowledges them existence, you'll find little or no practical reference to them. John Rampling shows you how to write a program to derive those little used keys.

46

48

A selective RENUMBER: for your Vic, 64 or Pet

An extremely useful addition to your programming toolkit is a routine that renumbers the lines in a Basic program. But that may bury you well constructed and easily identified subroutines. The answer might be a routine that renumbers selectively.

Tommy's Tips:

This month Tommy answers a mixed bag of queries for both Vic and 64.

Thorn in the side

There's an ever increasing number of banana skins littering the games software industry. What with some of the latest games tapes costing as little as a Big Mac and chips, and the enormous amount of pirating that allegedly goes on, there's a general feeling that it will all end in tears.

But Thorn EMI Computer Software is trying hard to stem that tide. Its distribution arm is now making available the complete series of Vic and Commodore 64 games from American software house Hesware (it stands for Human Engineered Software). And they actually cost more than the norm.

Games that cost more rather than less? The thinking behind that may be hard to swallow, but it's part of a policy which, according to Henry Krichen, TECG distribution marketing manager, "is to bring order to chaos" - his definition of "chaos" being bad distribution and insufficient profit margins for dealers. "Although we were late, we've come in to do it properly," he asserts.

So TECG is using its record distribution experience to set up

a nationwide dealer network and price games to suit the seller as opposed to you, the customer. You will receive telephone technical backup and help on where to find your nearest dealer. But it still leaves you paying a suggested £9.95 for a tape-based game. So you'll be expecting something pretty special for the money.

Games preview

In terms of innovation, all games have turbo loading which makes the tape load about as quickly as a disk. For the 64, the most original Hes game is *Pool Challenge* - joystick as pool cue substitute. There's an adventure

game featuring ghostly mazur and Count Dracula, and *Maze Master*, an incredibly complex 3D maze adventure.

For arcade fans there's *Mr TNT* - unmeasurable explosions, *The Pit* - tunnel your way through an alien planet, and *Rootin' Tootin'* - lots of

SHORTS

Olympics. Those of you who feel like taking part in Olympic sports from an armchair position will be pleased to hear that Database Publications has converted its Micro Olympic game (originally on the BBC B) for the Commodore 64. Ranges from 100 metres to the hammer throw enthuses the buzz. Apparently, you attempt to beat the computer in all these events to set up a new world record for medals though. The game should be available in time for the real Olympics, and will cost £5.95.

Al computer input on the front generally results in characters too fuzzy to be read with any ease and comfort.

The Philips set has a composite video input for video signal, or a 6-pin DIN RGB sound and various sockets.

It's easy enough to make up a special lead to go into this from the 64's 5-pin output (see page 143 of the 64 user's guide).

malevolent musical instruments complete with brilliant sound.

The Vic also gets a maze game called *Shamus*, and *Pharaoh's Curse* - an adventure that needs 16X expansion. Graphics are

Hesware's range also includes some educational software which is even more expensive at £14.95. For the 64 there's *Paint Brush* (lines drawing using joystick) and *The Factory* (create geometric designs on an assembly-line just like real life, innit?). The Vic also gets five such games aimed at youngsters, which teach basic numeric, writing and keyboard skills.

The list looks pretty comprehensive, but whether you're getting value for money and consequently whether you're going to buy them is a different matter. American games are already available at a slightly cheaper price, and turbo loading is fast becoming the norm even on less expensive tapes. Well be reviewing the Hes games soon to find out.

Meanwhile, TECG plans to distribute more Hesware later this year. They will be for the 64 have a strong educational element and, according to our sneak preview, look to feature pretty impressive graphics.

Who knows what prices will be like by then?

SHORTS

Seeing double. Audiotech has just announced its version of a pretty obscure arcade game called *Burnin' Rubber*. Yet another great game for the Commodore 64*, according to the buzz. Close scrutiny reveals invention of racing through four seasons running other cars off the road flying over obstacles. Money? That's exactly what *Bubble Bus & Bumping Buggies* does - a game that's been about for some time.

Like its yet another example of software house copying the same arcade game but time not even a popular one. The reasons are obvious.

According to Audiotech's Henry Arthason, copies of arcade games can be incredibly big sellers. In any case, it's very difficult to be original these days. Over to Bubble Bus Director, Mark Meekings: "we've now decided that everything we do in future will be completely original. Would software house like to copy that?"

Low-price monitor

Altogether the growth of the home computer market, a number of TV hardware companies have started advertising that produce as 'monitors' though frequently all that means is an input socket that bypasses the TV tuner.

Philips, however, is the sort of company unlikely to stoop to such hype, and its new high-res 12in monitor is exactly what it says and the recommended price is less than £70.

A monochrome set, with green-phosphor screen, it's obviously aimed at the word-processing and business applications markets, for whom anything less than 80 columns wide is out of the question.

But 80 columns on a TV unless it's Sony's fine 14in set with the spe-

cial computer input on the front generally results in characters too fuzzy to be read with any ease and comfort.

The Philips set has a composite video input for video signal, or a 6-pin DIN RGB sound and various sockets.

It's easy enough to make up a special lead to go into this from the 64's 5-pin output (see page 143 of the 64 user's guide).

Who shot Javerr?

If you're missing your *Ewing* viewing and pine for those grisly cardboard-cutout denizens of South Fork, succour is at hand. But you'll need a Commodore 64 and a disk drive.

"One of the most popular shows of all time is now playing on a computer screen near you." So goes the blurb for *The Dallas Quest*, an American adventure game for the 64 from Datsoft that's wended its way across the Atlantic - courtesy of British distributor US Gold.

The game was written by Lorimar, the company responsible for the TV series. It also designed the numerous hi-res screens. That means it's

Ellen, Lucy, Ray, Krebbs and the rest of the oily clan can continue their wicked (and predictable) machinations and evil plots and cunning deceptions and . . .

Here's a sneak preview of the plot. You're a super-sleuth hired by Sue Ellen to uncover a missing map that reveals the whereabouts of a South American mega-oid-ield. Of course she wants the Texas tea for herself. But JR's been listening out in the hallway - "In nobadise gonna stop me gittin' that oil".

The game is available only on disk and costs £14.95. According to Geoff Brown of US Gold, that's a real bargain. "It costs about £25 in the States", he claims. One of our resident tycoons will be reviewing it real soon.

SHORTS

Not Kidding: Eddie Kidd's greatest claim to fame is jumping over 14 double-decker buses on a motorbike. That makes him either brilliant or rather silly, depending on your point of view. But even daredevils like Eddie must take some time off from death-defying pursuits.

So he's now helping Martech produce a game called *Jump Challenge* for the Commodore 64, which simulates the act of leaping over increasingly difficult and dangerous obstacles. Martech reckons it will 'test the nerve and skill of every player' and is incorporating a national competition into the game, which should be available in August. Eddie Kidd probably won't be entering - he'll be too busy jumping over the English Channel.

SHORTS

Daisy goes down: We have sounded the praises of the Juki 6100 - at around £400 we considered it a real bargain-basement daisywheel printer. Enter the Daisy Step 2000, described by its blurb as "the first fully featured daisywheel under £300".

Actually it costs only £289 and it features a lot of facilities found on much pricier models: bidirectional printing, full QWERTY compatibility, super and subscript, bold, shadow and

underline proportional spacing. Two problems - the print speed is a sluggish 16 characters per second. And a Centronics interface is supplied as standard (RS232 is optional) so you'll have to buy an interface to attach your Commodore computer.

Still, if you do need letter-quality print at that price it's probably well worth it. More details from Keytek on 0932 242777.

Rings a Bel?

Newcomer to the bizarre home computer software business is Bel Tech, which has decided to shun the so-far lucrative games software market. "We took a management decision not to write any games",

asserts John Marshall, one of Bel Tech software developers.

According to David Lane, the company's MD, "within two years, the more sophisticated home computer software will be out-selling

games". So Bel Tech is producing "sophisticated software" for the Commodore 64 et al, and hopes to be around if or when we can all be lured away from our joysticks.

But it gets funnier: Bel Tech is an offshoot of Hindgworth Engineering which manufactures water pumps for trucks and tractors. Admittedly, that company developed computer software for its production control systems.

Most interesting is Bel Basic, a cut-price and cut-down database that comes on tape for £13.88 and on disk for £15.25.

John Marshall, the man who wrote it, reckons it will be useful in the home for keeping records of, say stamp or record collections. "We haven't really identified who will use it. Being so cheap, it will probably generate a lot of uses. It's certainly what I'd want, but I don't know about other users." At least that's refreshing piece of honesty.

Coming soon for the 64, according to Bel Tech's blurb, will be Bel Graph, "advanced function plotting, input your own equations,

parametrics, bar and pie charts, line graph, input data from file or keyboard, edit, save, name records and sort". That lot will cost you £14.88 on tape or £15.45 on disk.

Then there's Bel Chem, a series of two programs for 0-level chemistry revision. Each tape will cost £9.50 (about £3 extra for the disk versions). There are plans for a similar series on maths and physics - but no programs yet.

David Lane feels "a lot of educational software is very poor and does little more than display pages of text on the screen. Our intention is to create educational programs that encourage genuine user involvement". No comments on that since we haven't seen the 64 version, yet. But the program was written by an ex-chemistry teacher.

If none of that is to your liking, you might find the Bel Gen genealogy recording program more interesting - plot your family's descendants from Estonian royalty? The will sell for £12.80 on tape, or £13.90 on disk. More details on 07462 5430.

ghow All the Fun of the Fair

by Henry Deckhand

Speculation is rife whether the promised champagne breakfast of Commodore's two new home computers were the main attraction for the mass of press who turned up early at the concrete monstrosity that is London's Novotel, venue for the Commodore Show. Certainly the Commodore 16 and Plus 4 have existed on paper (in various guises) for longer than the assembly's combined memory could stretch. Could they still be news?

Howard Stanworth, Commodore's UK general manager, opined helpfully that this was 'the biggest and best show yet'. Pencils scribbled it all down dutifully. We went on to grapple with the three questions that have consistently exercised our collective intellects - and yours too, no doubt: Why buy a home computer? Why buy one now? Why buy Commodore?

The answers centred on the fact that Commodore has achieved firsts in every conceivable facet of the business at a time when computer companies are going to the wall with suicidal regularity. 'We're here to stay' vouchsafed Stanworth. The press stayed to catch a glimpse of the 16 and Plus 4.

It looks as though the colour of the season is ochreous grey, a colour best suited to funeral

parlours. Both the 16 and Plus 4 appeared in this sombre livery, as well as their new 1542 disk drive, 1531 Datasette and assorted printers.

Out with the old, plug in the new

The 16 is the result of throwing the Vic and 64 into a spin drier and picking out all the bits that managed to make their way to the top - sprite graphics and the SID chip apparently sank. But its enhanced BASIC (75 commands) and larger memory will probably sound the death knell for the persistent Vic, despite what Commodore says ('We'll sell the Vic as long as people want to buy it'). The 16 will sell only as a starter pack, costing £129.

Physically, the 16 looks like a Vic 64, though there are real cursor keys on it, but Commodore has once again thrown its famed incompatibility Spanner into the works. The 16 and Plus 4 have a new 7501 processor, new cassette port, new joystick sockets, throw out the old plug in the new.

At least the two machines are upwards-compatible, meaning you can run 16 software on the Plus 4 (when there is some available). They can share cartridges too. Needless to say 64 cartridges won't run on the Plus 4.

The Plus 4 does look different to its ancestors. It has a keyboard rather like the one on the SX portable and features a set of arrows (they look like

compass points) rather than cursor keys. With its four built-in pieces of software (rudimentary word processing, spreadsheet, database and graphics) it will cost £249.

Both machines can use the new SFS disk drive which performs better than the sluggish 1541 but will cost around £150 more. That will probably dampen the enthusiasm the Plus 4 might have inspired in small business users.

Commodore means business

Seeing is believing, we saw the 16 and plus 4, therefore they exist. We nearly saw Commodore's two new and 'coming soon' business machines in what was described as a 'development sneak preview'. Through what we got was a cleverly disguised Hyperion 16-bit portable micro sporting a 'Commodore PC' logo.

Uncharitable claims that this might actually be a Hyperion were summarily quashed. 'Substantial internal changes' have already been made. Moreover the PC will feature a larger screen, a redesigned case and a desktop version. No-one dared delve deeper.

Equal weight was given to this machine's IBM compatibility, the technical data thrown but confused us into thinking that this may be the real IBM PC and that the IBM PC itself is merely PC.

compatible the question of price brought us back down to earth. 'We're always right up there on the pricing side', said Commodore's Gail Wellington, not the best person to pin down for an exact figure.

Then came the 2-machine (pronounced Zee-machine). This is Commodore's most ambitious project yet - albeit clad in an old-style Pel case since its own case lingered disconsolately at Heathrow Airport. Over to a member of the Zee-team for a technical précis: 'A 8000 processor (pronounced Zee-8000).

Coherent operating system, 16-bit data bus 256K RAM 1024 x 1024 screen resolution, windows and icons, I/O subsystem. The press was duly impressed and scribbled energetically.

Under the barrage of inevitable price-and-availability questions, Gail Wellington stood firm. Well fairly firm. 'Everything is flexible and subject to change'. How true now true 'it's too early to give a final price. But when we announce it you'll be amazed'. When the announcement arrives we may well have forgotten what that announcement was about. Enough questions, the hustle and bustle of the Show downstairs could no longer detain us.

So you didn't manage to get down to London for Commodore's recent Fifth International Computer Show extravaganza? You didn't shove along with the crowds, get plastered with stickers, play a few games, find out what's new? Henry Deckhand did just that and survived to file this special report.

Upstairs, downstairs

Sensibly, the Show was split into two sections: business upstairs, zapping and other recreational activities downstairs. This organisational leaf meant that the cacophony of computer-generated noise did not impinge on more serious pursuits. It meant that upstairs was somewhat less than crowded. And it also meant that the labyrinthine passage between the two halves became the most crowded of all.

Radio Luxembourg wed with the software houses downstairs to see who could produce the most sound, but scored maximum points for manic idiocy of presentation (there was no real competition). It produced a few body poppers, some semi-ascii 'Commodore lovesies' and guest celebrities. Those included Shrimps Moss, the sonorous Patrick Moore, George Best (who broke a Commodore joystick playing International Soccer) and a IV-AM personality nobody recognised.

Commodore User produced its own celebrity: Peter Eastwood, winner of our mammoth £1,000 competition of software and add-ons from Pilot Software. City Peter (more than six feet tall) received his stack of goodies and a few words from DJ Dave Eastwood (almost less than five feet tall; Eastwood spent a great deal of time standing on a chair).

Across from RI's stand a Cut Figure was to be seen in the shape of the bearded and approachable Jeff Minter. Rumours abounded that he never left the **Umaxsoft** stand, content to chat idly with a throng of overstruck youth. Apart from *Sheep in Space*, Jeff's latest offering is a conversion of *Melogalactic Llamas* for the 64. 'The result is a very nice blast.'

Apart from its new Le Mans driving game (hence the presence of Sterling Moss)

Commodore had a pre-release version of *Basketball*, written by Andrew Spencer at International Soccer fame. It will be released on cartridge, will cost £9.99 and looks to be up to Andrew's excellent standards. Certainly it uses lots

Outsider's view

by Chris Durham

Regular contributor Chris Durham spent a couple of days at the Show. Here are his reflections...

The fifth Commodore Show was once again a mixture of sights, sounds, heat and people, amongst all the goodies that everyone had come to see. Some of it was excellent, some of it was less than breathtaking. But overall I think we got a sense of progress, of moving forward to new areas and new limits for owners of Commodore computers. Just what you want from a show like this, in fact.

The first thing that sticks in my mind is the great improvement in games graphics over last year; there were many more games for the 64 this year, and visually they were vastly superior to many of those previously available.

Another area which has grown since last year is the field of 'do-it yourself' graphics packages. In spite of the lack of Basic commands, the 64 has quite reasonable graphics facilities, judging by some of the entries for the 'Graphic Art' competition and the demonstration pictures for the Koala graphics pad, these are now being taken to their limits.

Likewise the musical side of the 64, at least two excellent sound systems were on display, *Musicalc* and the *Midi synthesiser interface*, plus a number of cheaper synthesiser programs for those whose musical ambitions are rather more limited.

The big disappointment of the show was, paradoxically, Commodore. After all the hype over the new machines I was expecting something rather more up-market; in fact at first glance I thought the Plus 4 was the cheap games machine!

I also fail to see why Commodore brings items to display, places them three feet inside a barrier so you can't see them properly, and then neglects to provide any information about the products. I asked for information on both *Magic Voice* and the new modem, but no fact sheets were available, and the people on the stands were unsure about any of the important details.

Overall, though, the Show was good value, it gave Commodore owners the chance to see what was available for their machines and to check out some of the new products lined up for the future. I would take bets that attendance was down on last year, though:

Certainly some of the exhibitors reported takings well down on last year's figures. Perhaps people are being a little more selective about what they spend their money on these days, but whether they spent money at the show or not I suspect you will find few who regretted going.

of the stylistic tricks from Soccer.

Bubble Bus showed two new games on a stand cunningly disguised as a bus. The disguise was near-perfect since the bus was parked motionless in the middle of the road. *Flying Feathers*, on eagle shooting game, has already received complaints from a bird protection society. So far, nothing has been heard from the AA about the other newish

the *Bumping Buggies* Bath cost £6.99

Equally eccentric was **Audionetics** a disk-based *Alice in Videoland* for the 64 costing £12.95 - announced about a dozen times since it appeared at the last Commodore Show. It has four scenes, all of which display quite stunning graphics. Most of Lewis Carroll's nutty characters are present (including the Jabberwock, galumphing along in hires mode)

Commodore conversions

On the games front **Stock** added to its already extensive list of goodies by showing a first version of what looks like a damn near unbreakable joystick - something of a *Quickshot* copy and built in unlovely plastic, but it has a nylon ball at the base of the stick which we just couldn't snap off in three days of *Frenzied Flight* simulation. Should retail for about \$8, which is pretty good.

New to the Commodore scene is **Micro Power** which launched four games for the 64 - *Ghouls*, *Cybertron Mission*, *Fails in the Factory* and *Swoop* - all of which have been converted from the BBC and Electron micros. They retail at \$6.95 each. More examples of the conversion syndrome come from **Quicksilva**, newly acquired by the British Electric Traction Company (publishers of a magazine called *Computing Today*). Quicksilva announced *Frashman*, *Escape* and 3D *Funnel* for the 64 newly transferred from the Spectrum.

Not to be left out, **Microsoft** has made its *First Steps* with the *Mr Men* programs available on the 64 (will we ever get *Ms Women* versions?). It also had a few new items to offer notably the Go-Sprite sprite editor for the 64 - that offers goodies like expansion contraction and inversion, up to seven layers of overlay, multi-colours and simple animation of up to 32 sprites. £9.95 on tape and £11.95 on disk.

Antilog showed an interesting three-in-one utilities package for the 64. *Gas-Kit* costs £14.95, adds 23 extra commands to Basic for graphics, animation and sound capabilities. Not to be outdone, **Bubble Bus** had the *Quadrillion* package of four utilities for the same price: word processor, label and poster printer and *Advertiser* which turns your 64 screen into a moving message display - handy for telling Johnny his dinner's in the oven.

For those with an artistic disposition, the 64 has spawned a couple of impressive drawing and graphics packages. One is the American-derived and much-heralded *Koala Pad*.

distributed in the UK by Audiogenics. It uses neither lightpen nor joystick but a touch-sensitive pressure pad which makes it as easy as drawing on paper. It's not very big, though, a notepad rather than a poster wall.

There's a range of eight brushes, the first one giving single-pixel definition. All the usual drawing functions are included plus facilities to move objects around, create mirror images, zoom, move objects to different pictures and save pictures on to disk. Obviously that lot makes it rather expensive - £59.95 for cartridge, £79.95 for disk software. We're reviewing it and will report.

Also from America comes the Super Sketch graphics tablet from a new Texas Company called **Personal Peripherals Inc.** This uses a stylus attached to a moving arm - the tablet's surface is not touch-sensitive. Like Koala Pad, its software is cartridge-based and will allow all the usual drawing facilities but four more cartridges will be available for graphics writing, musical notation, interior design and presenting business charts and diagrams like a slideshow.

According to Tom Hyatt, PPI's vice-president of engineering, "we're in the process of signing a major British distributor". When that happens Super Sketch should be available at around £59 - together with PPI's Super Stick, a smooth-operating joystick at around £9.

Moving up to business

With Commodore's two upstairs stands (which looked ominously like missile silos) was **Precision Software** whose success with Superbase allowed it to grab a considerable chunk of floorspace.

Precision is trying to make Superbase even more unassimilable as the database by introducing a clever range of products which run under it. Stepping Stones is a range of ten sample applications, costing £10 each, with data entry and file layouts already defined - for first-time users or people who can't be bothered to set their own parameters.

But to get across the idea that Superbase can be used at home (even more safely), there's the Homebase range which also runs under Superbase. Using one of these, you can store information about your favourite football or cricket team, all your books and records, birthdays, names and addresses, and even work but how many Gold Tops you've ordered from the milkman. With that lot, you'll be lucky not to tip

over all the databases you've created. The four Homebase packages cost £17.95 each.

Something more practical is 64 Doctor, a new diagnostic program for the 64 from **Practical Corp** at £17.95 on tape and £19.95 on disk. If you've shattered your nerves trying to find out what's gone wrong with your system, this could be for you. 64 Doctor checks out just about every facet of a complete system.

Also new from Practical is the PS programmable spreadsheet, an extension to its established and well-liked Practical PS lets you write subroutines in BASIC or machine code for advanced calculations and complicated manipulation of data.

To really confuse you, though, **Saxon Computing** displayed Figaro 64, which it described as "not a spreadsheet and not a database". Figaro is designed for storing a lot of numeric data and organising it in a form from which meaningful and colourful graphics can be generated, using Figaro's own graphics facility. It can also present those graphs sequentially in the form of a slideshow. Figaro 64 costs £65.

One of the technically most impressive bits of software we've seen for the 64 was on the **Supersoft** stand, a French package called Master which has been around for a while in PC versions.

This is a serious programmer's max-toolkit - it gives you a complete BASIC 4.0, all the usual toolkit facilities, and a machine code monitor. But it also provides extensive screen and printer handling, a genuine ISAM file system (up to 10 indexed files at once with keyed access and data compression) and an extended BASIC.

On the Technical Excellence stand, a word for those clever blokes at **RAM Electronics**. Latest 64 goodies include a £35 speech synthesiser, a cartridge speed-up for the 1541 at £50 (save and load three to four times faster than normal), and - wait for this - a 512KB memory expansion for

the 64. That wasn't on show, but it's promised for later this year. Don't ask me how they do it!

Accounts and maintenance

On the accounting front, **Anagram** is pretty well established now with its apparently bug-free and elegantly written accounts packages for the 64 and other Commodore machines. It also has a new product, Cash Book 64, selling at £7.50. At that price it should interest the self-employed or small businessman considering computerised accounting.

Breather from business

Most of the stands upstairs were devoted to business. One notable exception was our own **Commodore User** stand which was demonstrating Musicalc - new, American and very impressive (that's why we rushed to get hold of it). It's a music package for the 64, on show for the first time in this country that provides real music synthesis - the kind of thing you might pay a grand or two for from a professional synthesiser.

The Musicalc series consists of three packages: Musicalc 1, the synthesiser and sequencer (which forms the basis of the system); Musicalc 2, a score writer, and Musicalc 3, the keyboard maker. On top of that, there's a series of rhythm and backing templates, all of which turn the 64 into a fully fledged synthesiser. No prices are fixed yet since we haven't signed the debt; but at the Show we had Musicalc 1 at £45, £31 each for Musicalc 2 and 3.

Musicalc extends the horizons of your 64. So does the CompuNet network jointly developed by **Commodore** and **ADP Network Services** which was being demonstrated just across the way - another one that appeared in embryo form at the 1983 Show and then disappeared for a year

. Once you've bought your 64 modem (it costs £99.95 but includes a one-year subscription to CompuNet) you can do three things with it.

First, you can buy VisiSoft and other programs - which are then downloaded directly to your 64 over the phone. But how do you pay for the goods? Easy. When you register with CompuNet, you give it authority to directly debit your bank account.

That goes for the second facility too - Comp-U-Card the computer shopping facility. You can order anything from a Hoover to a heated trolley at discount prices* from the comfort of your armchair. And that's a good reason for keeping your 64 locked away.

The third facility is information services and electronic mail which includes basic functions as well as a facility called the Jungle, a billboard for buyers and sellers. You pay the cost of the call and a small charge for storing your message or advert on the central database.

For the ardent programmer who's cracked both BASIC and machine-code, **Oxford Computer Systems** had its new and mighty impressive Pascal compiler for the 64. The compiler costs £14.95 on tape and £49.95 on disk, both feature extra graphics and sound commands.

Why the huge price difference? Mainly because the cassette version has a resident compiler, the program is loaded once and sits there, taking up a large chunk of memory (about 160). Since a disk can be accessed randomly it doesn't need to store such a great chunk in memory, giving you the 64's own memory limit as the maximum source file size.

Oxford also displayed its great new driving game for the 64, Turbo 64. Being upstairs, it didn't get the attention it deserved.

Overview

Although the Show gave Commodore chance to launch its two new micros, it took a keen eye to spot the disappointing number of new and innovative products - most of the software and peripherals we'd seen or heard about already.

For those of you in Northern cities who were looking forward to a re-run of the Show in Leeds this September, the news is bleak: Commodore has cancelled it. For what reason? Officially, Commodore says the Show will clash with the company's move to its new **Corby HQ...**

Now there's a selection of hardware to match our selection of software.

At HMV we've just installed the latest ranges of hardware and peripherals alongside the massive selections of software in our Computer department. So whatever you need, whether it's a disk drive, or a Voodoo Castle or simply some expert advice, you'll know exactly where to find us.

Commodore 64	199.00	Complete range of Interceptor and Anirag software on Disk.
1541 disk drive	199.00	Large range of American Import on disk.
Commodore colour monitor	199.00	Selected Alligata and Software Projects titles.
MP801 dot matrix printer	199.00	Large range of Educational Software
Commodore C2N cassette recorder	44.95	Vic 20 starter pack
Dotex Commodore compatible cassette recorder	34.95	Vic 20
Memorex 40T diskettes (for 1541) box of ten	19.99	Commodore C2N cassette deck
Dialog business software (Cassette or Disk) each	30.00	32K Switchable RAM pack
Simon's Basic (Cartridge)	50.00	16K Switchable RAM pack
Petspeed Compiler (Disk)	50.00	16K Standard RAM pack
Z80/CPM (Cartridge and Disk)	50.00	Intro to Basic part 2 (Cassette)
Intro to Basic part 1 (Cassette or Disk)	14.95	Jet Pack (Cassette)
Intro to Basic part 2 (Cassette or Disk)	14.95	The Count (Cartridge)
Zork 1, 2 & 3 Adventures (Disk) each	11.95	Mutant Herd (Cartridge)
International Soccer (Cartridge)	9.95	Hell Gate (Cassette)
Voodoo Castle (Cassette)	9.95	Metagalactic Llamas (Cassette)
Solo Flight (Cassette)	9.95	Radar Rat Race (Cartridge)
Mysterious Adventures 1-10 (Cassette) each	9.95	Computer War (Cassette)
Son of Blagger (Cassette)	7.95	Complete range of Commodore, Llamasoft and Mogul software.
Killer Watt (Cassette)	7.95	Also: BBC, BBC/Torch, Memotech, Sinclair, Hardware and Software, and a large range of books on various subjects.
Contract Bridge (Cassette)	9.95	
Flight Path 737 (Cassette)	7.95	
Fire Ant (Cassette)	7.95	
Aquanaut (Cassette)	7.95	
Eagle Empire (Cassette)	7.95	
Manic Miner (Cassette)	5.95	
Snooker (Cassette)	8.95	
Twin Kingdom Valley (Cassette)	9.50	
Horrier Attack (Cassette)	6.95	
Black Hawk (Cassette)	7.95	
Slurpy (Cassette)	7.95	
Complete range of Commodore, Mogul and Level Nine software.

Garbage Collection on Commodore Computers

Part 2

by Jim Butterfield

We have looked into some of the causes of garbage collection delays, and have investigated some of its working mechanisms. It's time to put our knowledge to work. First, let's develop some rules.

The following program will help us see the rules by means of examples:

```
100 DIM AS(800)
110 FOR J=1 to 800
120 AS(J) = "A"
130 NEXT J
140 PRINT "X"
150 PRINT FRE(0)
160 PRINT "Y"
```

The Rules of Garbage Collection

Rule 1: There are static (in place) strings and dynamic (created) strings. Only dynamic strings have garbage collection consequences.

Proof: Run the above program (which contains only static strings). There will be no significant delay between the printing of X and Y. Now change line 120 to read ...

```
120 AS(J)=CHR$(65)
```

Run once again, there will be a significant pause between the printing of X and Y.

Rule 2: Garbage collection time depends on the number of dynamic strings you keep, not what you throw away.

Proof: Change line 120 to read ...

```
120 AS(J)=CHR$(65):AS(J) = "A"
```

Run the program. Even though we're throwing away a large amount of garbage (the first AS(J)=,), there's no significant delay.

Rule 3: Performing a garbage collection saves you no time on the next one.

Proof: Enter line 120 as ...

```
120 AS(J)=CHR$(65)
```

Run and note the delay. Now type **GOTO 140**. Note the delay is exactly the same as before; the previous collection saved us no time.

Rule 4: Doubling the number of strings will multiply the delay by 4. Mathematically, we can say that the time varies as the square of the number of strings.

Proof: Change the value of 800 in lines 100 and 110 to 400. Run and note that the delay between the printing of X and Y drops to one quarter of the previous time.

This last rule is the killer. You might work out a test program using ten strings, and when your program works satisfactorily expand to one thousand items. But your garbage collection time doesn't increase by a factor of 100 ... it jumps to 10,000 times the original delay. This could become crippling.

If you know what to look for, you can usually avoid massive garbage collection delays. There's no single technique that will

do the job. It's best to investigate what's causing the garbage and decide on the appropriate action to eliminate the problem.

Here's a list of techniques to get around the garbage collection hangup.

One: Don't move strings around

Suppose we are writing a program to input several names and sort them into alphabetical order. It would seem logical to move the names so as to put them into the right place.

Don't. Use an index array, which contains only numbers: move the index values, not the strings. A simple example:

```
100 PRINT "INPUT TEN NAMES"
110 NS$(10),I$(10)
120 FOR J=1 TO 10
130 PRINT "NAME":J;
140 INPUT NS(J)
150 I$(J)=J
160 NEXT J
170 PRINT "SORTING.."
180 FOR J=9 TO 1 STEP -1
190 FOR K=1 TO J
200 IF NS$(I%(K)) < NS$(I%(K+1)) GOTO 220
210 I=I%(K):I%(K)=I%(K+1):I%(K+1)=I
220 NEXT K,J
230 FOR J=1 TO 10
240 PRINT NS(I%(J))
250 NEXT J
```

The above program uses a bubble sort technique, which is notoriously inefficient, but the point here is that the strings NS\$()

are never moved. Thus, there can be no garbage collection. Note that the index array must be initialized before use - see line 150

Two: Clean up between blocks

Suppose you're reading in a large file of students from various courses. For a number of reasons - especially processing convenience and shortage of memory - you don't read in all the students. Instead, you read and process a class at a time.

Before reading in the next class, set all student names, etc. to null strings. Now, force a garbage collection with a statement such as Z=FRE(0). There will be few or no strings to keep, so garbage collection will be fast. When the next block of data - the next class - comes in, it will have freshly cleaned memory to use.

Three: Do local cleanups

Many programs like to build strings from GET statements. The code often looks like this.

```
500 PRINT "TYPE IN YOUR NAME"
530 N=" "
540 GET KS:IF KS=" " GOTO 540
550 IF KS=CHR$(13) GOTO 600
560 NS=NS+KS
570 GOTO 540
600 ...
```

This sort of thing creates a lot of garbage. Every time line 550 is executed, a new NS is created and the old one is thrown away; and NS gets bigger and bigger all the time. There's also garbage from KS, but it's only a single character at a time.

If NS and KS were our only strings, we'd have no problem. Garbage collection time depends only on what you keep, not what you throw away; and keeping two strings isn't much work. But if this were part of a program which also had a thousand names and addresses we'd be in trouble; everything would need to be reclaimed, and the delays would become impractically long.

If we're careful, we can get around this problem by setting the stage for a 'local' collection. We might reason as follows: during the above code, NS and KS are our only working strings. If we make all the other strings disappear momentarily, we may generate all the garbage we like, since garbage collections will

be virtually instantaneous. When we're finished, we must carefully force one last collection to get rid of any leftover garbage, and then make the missing strings reappear.

We can do this temporarily moving the top-of-Basic pointer down to match the dynamic string pointer. This will fool the garbage collection routine into thinking that there are no dynamic strings except the ones we have just created. But we must remember to put the top-of-Basic pointer back when the job is finished, or we'll suffer permanent loss of memory.

The top-of-Basic pointer may be found on the Vic and 64 at addresses 56 and 56. We must save the values there so that we can replace them later, and then use the contents of the string pointer (51 and 52) to change the top-of-Basic pointer. (In the PET/CBM, the top-of-Basic pointer is at 53 and 53, and the string pointer is at 48 and 49; we'll show coding for the Vic/64 below but you can adjust it for your machine.)

Here's how we would change the above coding to eliminate garbage collection dangers:

```
500 PRINT "TYPE IN YOUR NAME"
510 A1=PEEK(55):A2=PEEK(56)
520 POKE 55,PEEK(51):POKE 56,PEEK(52)
530 N=" "
540 GET KS:IF KS=" " GOTO 540
550 IF KS=CHR$(13) GOTO 580
560 NS=NS+KS
570 GOTO 540
580 Z=FRE(0)
590 POKE 55,A1:POKE 56,A2
600 ...
```

It seems complex, and you must indeed code with great care. But it solves the problem.

Four: Use numeric values

Who says that everything that seems alphabetic must be a string? A month can be coded 1 to 12; a grade of A to F can be a numeric from 1 to 6.

Where the number of possible strings is limited - a class, a region, an airline - using a numeric system is quite feasible. You can always look up the string you want by using the number as an index and getting the name out of an array.

I wouldn't recommend that we all lose our names and become numbers within the computer. But a little sensible data reduction can save a lot of garbage collection.

Five: Brute force

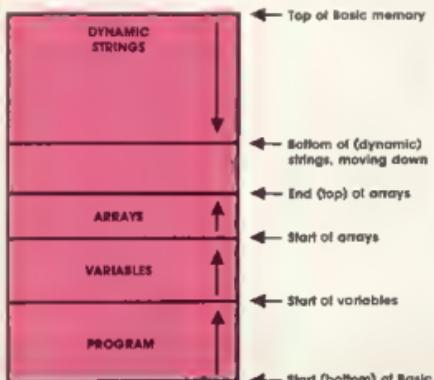

Sometimes conventional methods fail. Like your data consists of a large number of names which have been read in from a file: you need to make changes to a substantial number of these names. There seems to be no way you can control the amount of garbage. What then?

When all else fails, write out all your strings to disk. Set the strings to null values and force a garbage collection - this will take place instantaneously. Now read them back in to the newly cleaned up memory.

You can watch the string pointer (addresses 51 and 52 on the Vic/64), and when it seems to be getting near the danger point, initiate that whole operation. At least it will be under your control: you can print a message to the user (TAKE A BREAK WHILE I ... UNSCRAMBLE MY BRAINS), and may even get the bonus benefit of having generated a data backup or 'checkpoint' in case of loss of power.

And it's a lot better than having the machine go dead for twenty minutes ... or more.

Adventure

Games

The Commodore 64 is a particularly good machine for adventure games because of its large memory. So it's not surprising that a large range of games are now available to suit all adventuring tastes. Here's a sample of offerings for the 64 - and one for the Vic. Coming soon, an occasional column of tips and playing hints for the adventurer

ADVENTURE QUEST

Commodore 64
Keyboard only
Price £9.95

Adventure Quest is one of a truly outstanding Middle Earth trilogy from Level 9 Computing, featuring a neat scrolling text with no memory wasted on unnecessary pictures. By using a super-compact language and text compressor, this program has well over 200 individually-described locations loaded with innumerable objects and characters. Result? A brilliantly constructed Adventure.

The comprehensive instruction booklet provided with the tape reveals that Orc armies have unleashed a savage onslaught upon Middle Earth. The last chance for survival rests with the faint hope of you finding the Black Tower, source of the enemy's demonic power, and destroying it. Entry can only be effected however by possessing the four Stones-of-the-Elements, which are scattered throughout a representation of Earth's history.

On the way you must overcome such obstacles as Roman guards, gladiators, lions, dragons, and even the perils of an abandoned coal mine (the best games are always topical - Ed). It is these heroic actions that provide the essential life force from which the dismembered slaves must feed to survive.

Feasibility Experiment follows the usual Mysterious Adventures practice of a split-screen display with both text and graphics.

I thoroughly enjoyed the experience but if it happens that your progress does grind to a frustrating halt, Channel 8 can provide a Clue Sheet for this and all the other Adventures currently available from them. LP

FEASIBILITY EXPERIMENT

Commodore 64
Keyboard only
Price £9.95

You are subject to a 'feasibility experiment' alone on an artificial world constructed by a dying alien race. Your mission is to collect a number of treasures scattered throughout a representation of Earth's history.

On the way you must overcome such obstacles as Roman guards, gladiators, lions, dragons, and even the perils of an abandoned coal mine (the best games are always topical - Ed). It is these heroic actions that provide the essential life force from which the dismembered slaves must feed to survive.

Feasibility Experiment follows the usual Mysterious Adventures practice of a split-screen display with both text and graphics.

CIRCUS

Commodore 64
Keyboard only
Price £9.95

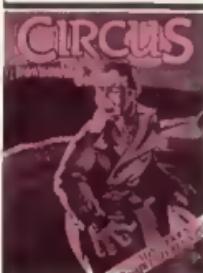

Out of petrol, miles from anywhere, you stumble across the darkening landscape in search of human habitation and, perhaps, assistance. You hear a faint noise and are drawn on until, in the distance, you recognise the blazing lights and bucolic roar of a seemingly harmless circus.

As you race toward the main gate a sudden deathly silence descends and blackness envelopes the site. You are about to enter the mystery of a ghostly Big Top and its apparently doomed inhabitants.

Although I found that not too difficult, Circus is an original and interesting conception, the mystery of which is revealed as you progress. This must be resolved and finally you must escape with your life. That is, if you haven't already made a fatal mess on the canvas wall or the sawdust ring for that matter! Certainly a refreshing change from my usual haunts of dispelling dungeons and endless dark tunnels. LP

MISSION IMPOSSIBLE

Vic-20 (unexpanded)
Keyboard only
Price £9.95

Or Secret Mission as it is now named, because of objections to its original title by the TV series. This Scott Adams Adventure cartridge is text only - it opens with you alone in a Briefing Room with only a tape-recorder for company. Playing the tape reveals that your mission, 'Should you decide to accept', is to prevent the detonation of a large time-bomb concealed in the depths of a nuclear power station.

As you're stuck inside said power station anyway you have little choice but to accept this task and locate the device. I soon realised that to penetrate all sectors of the power station I would require the relevant Security Passes. Getting this together initially took some time - too much time, in fact. More than once my surgically-implaned bomb detector indicated 'Condition Red - Final Countdown Begun'.

Although rather limited in locations and objects, this Adventure certainly had me puzzled in places. Keying in 'Score' to find out how I was doing, I was greeted with 'In this adventure, there's NO score! Either you make it or - Well, I did make it eventually - in two intense hours. That was the only disappointing facet to this very playable Adventure. It was my first stab at a Scott Adams product and having read so much about The Man and his work, I was expecting a longer stay at the keyboard. Difficulty rating - moderate, but recommended for beginners! LP

PERSEUS & ANDROMEDACommodore 64
Keyboard only
Price £9.95

This Adventure places you in the turbulent times of Ancient Greece. You are Perseus, commanded by King Polydectes to search out and decapitate Medusa the fearsome Gorgon, then to rescue the fair maiden Andromeda.

Never one to disagree with a King, you wander about what seems at first a rather limited setting. Eventually however your horizons broaden, and with care you won't be crossing the river Styx too often!

There is some assistance to be had from the Gods as you go from one location to the next, encountering some of the creatures to be found in Greek mythology - most of them hostile. "The Gods will cut out your tongue!" threatens one of them.

As with all the Mysterious Adventures from Channel 8, the top half of the screen can give either a brief description of your location, or a reasonably well-drawn picture. The bottom half handles the questions and answers. The two-word input, however, can sometimes leave you with the frustrating search for the exact vocabulary. Channel 8 LP

**TRANSYLVANIAN TOWER**Commodore 64
Keyboard only
Price £5.95

This 'Graphic Adventure' is set in the five floors of Count Kneep's castle, each floor represented by a

different maze.

At the start you are placed in the dungeon, you must find your way through 100 rooms to locate the main exit, using the arrow keys for movement. On each move, you're presented with a (very plain) 3D illustration of the room you have just entered and the exits open to you.

Once the main exit has been found, there is a 30-second wait for the next maze to be generated. From here on you will encounter the vampire bats which can be killed by a variety of weapons. The bats and weapons are randomly scattered throughout the myriad of rooms, and only by killing a required number of bats are you allowed to exit to the next floor. Killing a bat also gains you a brief look at the map and your position thereon. Ultimately you must reach the fifth floor, kill the Count, and steal his treasure.

THE TIME MACHINECommodore 64
Keyboard only
Price £9.95

Search for a kidnapped Professor using his temperamental time machine. You must first locate this contraption, and then use it to travel through time in a somewhat haphazard fashion, to uncover three glass urns each hidden in a different era of Earth's history. Locations include the ring of a deserted sailing ship and the treacherous sands of Egypt.

Once in possession of all three urns you can control the time machine.

I found this the easiest of the Mysterious Adventures series - which by no means detracts from it, but the competent Adventurer should complete this in an evening or two. The presentation is the customary split-screen, the top half displaying the graphics and location description, the bottom for questions and instructions. Channel 8 LP

TEN LITTLE INDIANS**TEN LITTLE INDIANS**Commodore 64
Keyboard only
Price £9.95

One of the 'Mysterious Adventures' series from Channel 8, Ten Little Indians is an intriguing investigation into the whereabouts of a valuable gold figurine - the precise location of which is only revealed when ten other worthless figurines have been brought together.

The Adventure begins innocently enough - you find yourself standing alone in a railway carriage, proceeding to the mansion of the late Major Johnson-Smythe where you believe the gold is to be found. When you eventually manage to disembark and head for the mansion, you are given several opportunities to become a deceased person - which I did, frequently!

Locations range from the railway station and a riverside wharf to the mansion itself. Several figurines present themselves rather easily, but some are fiendishly difficult to find. Indeed a few of the problems posed in this Adventure were quite baffling.

The format is the familiar Adventure split-screen. The top half can alternate between a written location description and a fairly attractive picture of it, the bottom accomodates the question-and-answer text. There is the usual restrictive two-word input; but no matter, this is an enjoyable detective romp for the novice and experienced alike. Channel 8 LP

THE SORCERER'S APPRENTICECommodore 64
Joystick and Keyboard
Price £9.95

This package contains two tapes, labelled 'Action' and 'Adventure'. In the Action game you control a cloaked figure chasing about the screen trying to prevent a broom from dropping its buckets of water into your walled dam (which runs up the right side of the screen).

Nudging the broom with your little man causes the buckets to disappear and the broom to seek more water from a well. Occasionally brushes will scoop across to smash bricks from the dam, reducing its height. These also can be repelled at a muddle.

If the dam eventually overflows you lose one of your three lives. Surviving the time limit, however, rewards the password necessary to enter the Adventure. Clues to help you are displayed after each of three subsequent levels, each level has an identical screen display as the first but provides more brooms to contend with. Within each level the brooms do speed up considerably, and the action can become quite hectic.

Eventually, though, I found rambling around the same simple scenario rather repetitive - and in the end rather boring.

Loading the second tape revealed a well-presented text-only Adventure, covering at least 70 different locations in and around a rather unusual castle. Passing through the myriad of rooms you come across a number of spells each can be entered into your Spell Book and used at your leisure. Ultimately you should reach the Wizard's throne armed with the spells capable of stopping those infernal brooms.

Most of the spells are essential to your progress, which is hindered by such delightful characters as an Egyptian mummy, a fire-breathing dragon, and even Old Nod himself.

I found this an interesting Adventure, fun to play, and rather addictive. Unfortunately though, it's another program the experienced Adventurer would do well to forget.

Turn your 64 into a real number cruncher with the

64-STATSPower

professional statistics package

Ideal for forecasting, business, schools, research workers, hobbyists, marketing, administration, and scientists.

Comprehensive manual with many worked examples guides the user (novice or professional) through the use of the various statistical techniques. Extremely user-friendly programs plus easy-to-follow manual virtually form a self-contained course in statistics!

CONTENTS:

SUMMARY STATISTICS: Means, Median, Quartiles, Semi-interquartile range, Variance, Standard deviation, Skewness & Kurtosis measures

CHI-SQUARE TESTS: One-way classification tables,

two-way classification tables.

DE-SEASONALISATION: Daily, weekly, monthly, quarterly de-seasonalised forecasts.

MOVING AVERAGES: User-defined length of average.

REGRESSION ANALYSIS: Many advanced features. Data transformation options, Dummy variables, R-squared, D.W., F-statistic.

T-TEST: Confidence intervals for population mean, pair-wise comparisons.

ANALYSIS OF VARIANCE: One-way and two-way analysis.

Fantastic value at only £14.95 (Sterling) Inc P&P.

Bal

Pilgrim in the Microworld

PILGRIM IN THE MICROWORLD
By Michael the Basement of Vice Sut

The Book: Pilgrim in the Microworld
The Author: David Sudnow
The Publisher: Heineman
The Price: \$5.95
The Reviewer: Bohdan Lasicak
The Conclusion: A complete run-down on Breakout... but for hardened enthusiasts only.

A video games arcade, with its wild-eyed, manic youth and cacophony of sound, looks like being a pretty fertile place for exploration if you happen to be a sociologist. But not many would take the extreme step of actually succumbing hopelessly to a video game - and then write a book about it.

David Sudnow has done just that, describing his experience as a pilgrimage through a microworld bordered by a TV screen. That amounted to him spending three months (or so he says) in virtual solitary confinement, trying to master the classic but now somewhat outdated Breakout. (You remember - you try to break through a wall of bricks at the top of the screen with a ball that bounces to and fro.)

So what's so special about Breakout? And can you really write more than 200 pages about such a simple game and not bore the reader to death? The answer probably lies in whether you've a games nut or not. Sudnow certainly wasn't before the day he retrieved his teenage son from a video arcade - that's how it all started.

But Sudnow probably wouldn't have fallen for the like of *Muscle Command*. "Play Breakout," he exhorts. "It's fun, it's agile, you don't have to shoot muscles or people or alien beings, don't have to be a human jackhammer, rapping your finger on a button hundreds of times a minute. Just back and forth and back and forth."

From the instant he's plugged the machine in and served the first ball, Sudnow takes us through his solitary experience chapter by chapter, recording

not just his own discoveries about Breakout and how to master it, but fathoming out the depths of that disease, game-mania.

Occasionally it all becomes rather wearing on your patience. Sudnow insists on recording the minutiae of his discoveries - the ways in which eyes, hand and paddles coordinate, the intricacies of strategic play, the ups and downs of developing greaser skill, the problems of concentration...

You can forgive him that: after all he is a scientist, eager to record faithfully every detail of his journey. What's less palatable is his liberal use of jargon - words like "neuroemotions", "motorific", "cathexis" and many more. On top of that, there's his occasional flights of rhetoric and literary fantasy. All that abstract stuff and his Americanisms may not be to your taste.

His quest took him to Atari's HQ in Santa Clara where he managed to dig up a few priceless gems of information. "I was amongst colleagues, fellow microbiologists," he enthuses. So there's nothing random about Breakout, he discovers. You could take a perfect path from start to finish and clear the screen with a single ball. Reinforced, he returns and plays on... and on, and on.

On a practical level, this book gives you all you ever need to know about the intricacies of playing Breakout and might inspire you to dust off your Atari console for a few quick serves. For the more abstract-minded, it's a passable study of a modern phenomenon. But to enjoy it, you really must have the same manic devotion to video games as Sudnow himself - and there can't be many like him around.

The Reviewer:

David Bohan

The Conclusion:

Save your money

Sprite Graphics for the Commodore 64 is an unusual book as it limits itself just to one aspect of the 64. This is an American import but for once there is little of the patronising that seems to pervade a lot of American books: the author (— about three years ago publishers started recognising the existence of female competence) has obviously spent a good deal of time researching sprites. And the result is a book that will give you a very good knowledge of sprites.

Good presentation, too: I particularly like the use of diagrams for explaining tricky subjects. These simplify the subject matter and are crystal clear.

There are also four pages of colour photos showing different sprites from the 25 example programs. A few of these are three or four pages long, with some dauntingly long lists of DATA statements.

One chapter is spent solely on binary notation and boolean operations. But it is done so painlessly that few should have any trouble understanding the concepts.

The last chapter is a question-and-answer guide to problems with sprites. I must confess I knew about the dreaded 'spuride', but I didn't realise it could trigger collision interrupts. (Spuride' is a phenomenon on older 64s where you get little flashes of light randomly appearing on the screen.)

If you really want to know the ins and outs of sprite programming from basic, this book is for you. Be warned though: it does not go into the real messy stuff of multiple sprites using raster interrupt, so if you know what that means then you see probably sense way beyond the scope of this book.

The Complete Commodore 64 ROM Disassembly is identical in purpose to Miles Battersby's *Inside the Commodore 64*, a pure reference guide for machine-code programmers and those who want to see how the machine code is written.

There isn't a great deal to say about ROM disassemblies except for commenting on layouts and formats — and price. The book at £5.95 is wider half the price of Battersby's... but it is lacking in content and presentation.

Pages 7 to 34 give a breakdown of all the system variables, main ROM entry points and memory map with 6526 (CIA) and 6801 (SID) diagram charts. Surprisingly though there's no VIC chip detail; and all of this information (apart from the ROM entry points) is available in the *Programmer's Reference Guide*.

The disassembly itself is from pages 35 to 188 with about 150 bytes disassembled per page. I was annoyed to see that a disassembler has been set straight to a printer with no attempt made to document tables of comments, jump vectors, or initial values. In fact the only information given is a title at the start of each block corresponding with the ROM entry points and saying what the code does.

The reader would have to spend a great deal of time with this before obtaining any useful information. And it's my belief that any machine-code programmer could have produced this book if they had a printer, disassembler and a little knowledge about the 64.

If you want a book that will give you information about the 64 ROMs, *Inside the Commodore 64* would be a much better buy — even at twice the price.

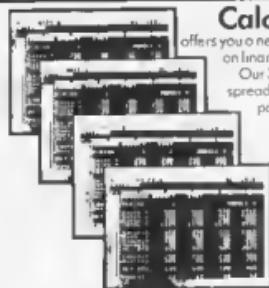

Now the Commodore 64 means business

The Game's over. Wouldn't you like to increase the applications potential of your Commodore 64? Transform it from a fun family computer into a truly professional tool? Now - thanks to Handic, the world's largest creator of Commodore software - you can give a powerful new dimension to your 64's performance. We have pioneered a new program called CALC RESULT that dramatically expands the financial planning potential of your Commodore. Doctors, Dentists, Lawyers, Bankers, Brokers and other money managers exploit it to keep track of complex client accounts. Builders, Garage Owners, Retailers of all sizes, and

descriptions now use the spread sheet formula for instant feedback and analysis of trading results. In a world where ease of access and speed of assessment are essential, CALC RESULT gives everyone the power to harness the untapped potential of their Commodore.

CALC RESULT is versatile... use it to calculate loan and mortgage payments, forecast budgets, balance cash flow, monitor stocks and shares, plan personal and corporate taxation, check expenses, log and analyse all kinds of bills.

CALC RESULT instantly translates figures into multi-coloured bar charts. It has a built-in 'HELP' function and is absolutely accident proof.

Calc Result
offers you a new perspective on financial planning. Our 3-dimensional spreadsheet sums up pages of figures in one easily understood financial model.

£49.95 (inc.VAT)

Calc Result Easy

Single page spreadsheet (64 columns x 254 rows). Built-in graphics. Formula protection, flexible print-out, colour conditional functions and mathematical functions. Delivered on plug-in cartridge. Data storage on cassette or disk.

£99.00 (inc.VAT)

Calc Result Advanced

All functions in Calc Result Easy plus 32 pages (1/3 dimensional viewing). Page add, window, split screen (up to four pages on the screen at the same time), and help functions. Delivered on plug-in cartridge plus disk. Requires disk drive.

For more information contact our Advisory Centre on 0344 778800 or simply contact your local Commodore or Lightning dealer, or clip the coupon.

I would like you to send by return post further information on the Handic 64 range.

Getting more from your Commodore 64

The Book:

The Author:
The Publisher:
The Price:
The Reviewer:
The Conclusion:

Getting more from your Commodore 64
 Mark Harrison
 Sigma Technical Press
 £8.95
 David Bolton
 Not bad, but has lots of competition

Getting more from your Commodore 64 is another book for beginners. It is a pretty solid work spanning some 300 pages, comprehensive in scope though it falls short in the area of machine code which is described but not introduced – not a serious failing considering the nature of the book.

Most areas are covered with plenty of examples but all techniques are taken from a primer with no amendments (for instance for cursor controls). At least one appendix gives a list of control codes. I noted the odd mistake here and there through the book, but there's nothing critical.

There were two subjects in the book which remind me of my computer science days – things like linked lists, hashing algorithms, binary trees, stacks and queues. There is also some pretty comprehensive disk treatment, including direct reading and writing sectors. You don't need a PhD to read this book, though.

My verdict? Not bad, but it has a lot of competition from similar books – this is the ninth book covering this area that I've reviewed. It seems to be the Fecman syndrome again: everybody has to bring out their own version ...

Introducing Commodore 64 Machine Code is a welcome change from most 64 books from a very prolific author who has written many similar books for other computers. There seems to be a lot of people out in 64 land who have mastered Basic, graphics, sprites and sounds and want to move on. Well, this could be the follow-on book for you.

First, a proviso – I think that this must be the author's first venture into 600/650/6510 programming as he has missed a few telling points along the way. For a start, the processor in the 64 is a 6510 not a 6409 (the difference is the addition of an I/O port).

That won't be bad; but saying that integer arithmetic is faster to use on the 64 than real is badly wrong. The 64 converts integers to real, does the arithmetic and converts the answers back to integer.

There is yet worse to come. Some of the programs listed leave the top of memory to protect machine code ... but they fail to do a CLR, so machine code would get corrupted after some string operations.

Last but not least, a major blunder: the 6510 treats the carry flag the opposite way round to the Z80 in subtraction. You set the carry flag, not clear it, before a subtraction; Ian Sinclair has got it the wrong way round. This is a mistake that will cause bugs which will be very difficult to spot.

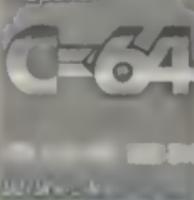

Despite these errors the book is well written – a bit more verbose than some, but the explanations are quite detailed. And I'm pleased to see he's made extensive use of Inside the Commodore 64 and the Mikro assembler cartridge, both favourites of mine.

My hope is that a revised second edition will come out very quickly. If this is the case then I would be glad to recommend this for the budding machine code programmer. As it stands though there are these annoying mistakes to caveat excepted.

 Annoying mistakes

COMMODORE 64 BASIC BEGINNER'S PACK . . .

A subtle blend of software and book to enliven the dullest of Commodore 64's.

The Software

Honey Aid 1: a complete utility that adds 28 new commands to Commodore 64 BASIC. In three groups.

- **Toolkit:** these commands help you to create your own programs in BASIC. One day you'll wonder how you did without them.
- **Graphics:** use colour and hires graphics with ease - decorate and colour your 64.
- **Synthesiser:** build all the SID chip's features into your program. No need for POKEs. Just use Honey Aid's BASIC-like commands

In addition - on the tape:

- **Char Gen:** a full-featured character generator that will redefine any or all of the standard 64 characters, even the ones used by Chat Gen - while it runs.
- **Sprite Gen:** a sprite generator to define sprites - normal or enlarged, single colour or multicolour. Displays the sprite as it's defined. Transforms the design into DATA statements.
- **Compositations:** explores the SID chip. Allows you to type in a tune and to store this in DATA statements. Later, you can recover this to re-create that tune.
- **Buildasound:** lets you explore all the features of SID and hear them in action.
- **Guesses:** a unique computer-aided simulation (CAL) of a number-guessing game. Demonstrates how each statement works and shows it all in action.
- **Hangman:** a full hangman game to provide entertainment and education.
- **Breakout:** a video ball game, break down the wall to score.
- **Blockads:** a two-player game, trap your opponent, they're trapped - you win.
- **Balltrap:** get the ball in the net to win - frustrating but fun!
- **plus, plus**

COMMODORE 64: VIC 20: BBC

The Book

A 360-page text that guides you step-by-step, through the 64's BASIC - learning as you go! Each piece of software on the tape (and many more) is developed stage-by-stage. Once the fundamentals of BASIC are mastered, the specialities of the 64 are introduced.

From a simple number-guessing game via a reaction-time programme and three video games to character and sprite generators, the projects increase gradually in complexity. This unique approach means that you learn - and that learning is fun!

Our regular round-up of games reviews

We get to see a lot of games here at Commodore User, so many in fact that we can't handle all the reviewing ourselves - we farm out some of them, which is why our reviews have someone's initials at the end of them. We look at everything we get, but we don't necessarily print all the reviews we write: instead, we tend to stick with (a) all the best games we come across and (b) those games that you're most likely to find in the shops or the mail order ads.

MINITRON

Vic-20 (Unexpanded)
Joystick only
Price £4.95

This game manages to annoy before you've even grabbed your joystick. The futuristic insect below a screen that's really bare and boring and the sci-fi story on the cover does nothing to tell you why you're tapping.

Oh well, better make an effort. Apparently, you're one of a small number of men surviving on a planet completely overrun by robots. Or maybe you're a robot? Anyway, there are mines, and things that could pass for robots to tap. That puts up your score. Then there's the little men walking across the screen. Do you tap them no, or are they robots that look like men? Trouble is, I can't be bothered to find out. **BB**

But in terms of presentation, this one's got a lot to offer. The sequences scroll and change colour, and there's a veritable cacophony of thumping and screaming sounds. Pretty impressive.

What about the game itself? Well, it's just a little less than lousy - one of those keep-your-finger-on-the-button games. Apparently, you're supposed to be tapping a row of phantoms at the top of the screen which grow to full size and then swoop down on top of you. The blurb says the phantoms have fired a missile at you. Beats me.

But the effects are pretty spectacular especially since the attack formations vary and become more intricate as the waves progress. It's all very bright, colourful and fast action. Graphics are a pretty high standard for the Vic. Apart from that, there's not much else to recommend this offering. **BB**

SKRAMBLE

Unexpanded Vic 20
Joystick only
Price £5.95

The full assault-and-battery course in *3.E.R.* is a tall order; nevertheless all the features are here.

Fuel dumps are tucked away in

ted terrain under constant attack from guided missiles, and if that wasn't enough you have a dwindling supply of fuel which can only be replenished by accurately bombing enemy fuel dumps.

But anyhow this version is pretty poor: the fire balls have no effect on you whatsoever, and the jerky movement and the fair-to-poor graphics go to make this a scourge on the name of *Skramble*. The only good thing about this game is the sound. **JJ**

PUNCHY

Vic-20 (+16K)
Joystick or keyboard
Price £19.95

So you think *Punch and Judy* is a soft touch? Well, with the barrage of rotten tomatoes, custard pies, snapping alligators and pugacious *Punch* himself, this game looks like being pretty tough. And pretty good fun to boot.

You're *Bobbie* the policeman, given the job of rescuing *Judy* who *Punch* has maliciously locked away in the booth. Brave *Bobbie* must run across a series of stage scenes, avoiding the edible nasties and jumping over various holes and pits in which *Punch* and the alligator lurk - not dissimilar in style to *Hunchback* on the Commodore

PHANTOM

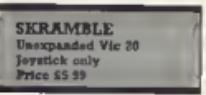

ATTACK

Vic 20 (Unexpanded)

Joystick only

Price £3.95

You can't expect much from a game that costs a chelat under £2

the rocky terrain and there are interceptor rockets aplenty to avoid or zap in the first section. The subterranean sector is really in two parts: the first being spacious with bouncing spiders to dodge, though it is easier to shoot them, suddenly the cavern becomes narrower and more tortuous with stalactites posing problems. Homing fireballs greet your return above ground followed by more rockets which crowd the city blocks. Then it's just a matter of negotiating the city-maze and landing at home base. Of course it takes quite a few goes to get anywhere near the terminals.

I found the colour combinations not to my taste, but the action leaves no doubt that this is a scintillating run. **LS**

64 If he makes it to the end, he will free Judy from bondage.

Occasionally an express salvo (sent from Judy) scars past. Catch three of those and Bobbie gets a free trip to the next screen.

But many of the screens repeat themselves, albeit with a few minor differences, but what do you expect for 16K?

Generally, the game is extremely well presented, especially in terms of colourful and vivid graphics. Can the Vic really do any more than this? There's a useful demonstration at the beginning, a high-score table, reasonable sound and lots of instructions on the insert. But with 16 screens to negotiate, Judy might be better off digging a tunnel. Definitely more fun than the beach at Sagamore. **BB**

SPACE ESCORT

Unexpanded Vic 20
Joystick or keyboard
Price £9.99

A fast-moving arcade game with you escorting a convoy of 26 space liners to their base planet - you task on the way is to defend the convoy with your fighter ships.

The liners themselves have four colour-coded protective shields each time a laser is hit by an alien ship (or random meteors) one shield is destroyed.

When first playing the game you'll find the speed devastating just the slightest movement of the joystick and you go zooming across the screen straight into the alien ships (or you might go crashing into your own liners, as I did more than once). Control takes some time to get used to but once this hurdle is over the game becomes a little easier.

The sound and graphics are quite good, each new wave of aliens makes a different sound to the last. And I enjoyed playing the game!

STAR DEFENDER

Vic-20 (+16K)
Joystick or keyboard
Price £7.95

Remove the star and what do you have? You have that good old arcade-favourite Defender!

For the uninitiated, you're in command of the last space fighter

Much better than the 64 version. Larger, variously coloured vehicles career towards your own car, which apart from moving laterally can also accelerate and brake. It's just a case of how long you can survive a bout of nightmare driving.

Worth considering if your reflexes are razor sharp and so long as you can tolerate the roar of speeding traffic. Not much time to appreciate the graphics, though.

Rabbit LS

Presentation:	*****

in your fleet. You have to stop the alien landers from picking up and carrying off your humans.

But this version has a trick or two, such as your ship being able to become invincible for five seconds, very handy. And also you have the 'War-gate' which transports you somewhere in space.

There are the mandatory aliens to face, things like 'Mutants', 'Bartars' and 'Space-humans'. These Space-humans fly behind you and try to collide with you. Bartars arrive if you have not destroyed after a certain time. The mutants appear when a lander takes a human to the top of the screen; there he/she'll mutate and will attack you with mindless vengeance.

The graphics and sound are quite good, large well-defined aliens and smooth graphics makes *Star Defender* one of the best versions of Defender yet produced. A good game all round.

TANK COMMANDER
Vic 20 (+ 8K)
Joystick or keyboard
Price £5.95

Your mission, should you decide to accept it, is to take your tank into enemy country and blow up the fuel and ammunition dump. Sounds like a piece of cake? Apart from mines and swamps, a few enemy tanks and a fighter jet, it's plain sailing - or plain tanking.

The nice thing about this game is that you can take your time and use a little strategy. Actually, that isn't optional; tanks don't exactly speed along and manoeuvring is pretty sluggish. And don't fire too often. You've got a limited amount of shells (displayed at the bottom of the screen).

Nice features include a screen that scrolls both horizontally and vertically, there's a one or two player option and the instructions provided are pretty comprehensive. Not a classic but a nice alternative to mancusing.

BB

Creative Sparks

Presentation: *******
Skill level: *******
Interest: *******
Value for money: *******

This game is not quite as menacing as the title and insect makes our De-spirits that, it's pretty good fun.

You're in an oblong room with an exit to either side through which the nasties come in. If there's no treasure in there, zap you're way through the nasties, make a quick exit and you're in another room. Apparently there's sixty of them but they all look identical - bit of a con. The idea is to rove the rooms grabbing as much treasure as possible to rescue some vapid creature called Princess Diana - no relation.

Occasionally, a transporter thing appears which you rush into. That seems to change the type of nasty. There's three of those: one of them fires back; I reckon those are the Elephants. You deposit treasure when you reach level seven and that rescues the princess.

Graphics are less than stunning, so is the sound, but action is swift and furious. Definitely worth a few loads.

NAME

ADDRESS

POST CODE

One of the things you may miss on the Vic is a machine language monitor; it's not there — unless you go out and pay for one. But for occasional use, a tape-loadable monitor might be very handy.

This one dates from 1982, when we originally printed it in *Vic Computing*. Since then we've had many requests for a reprint. It should fit on any Vic, with or without extra memory added, and it honours all the commands from the built-in monitors we know from Pet/CBM usage. One minor syntax change: the two addresses of the *Memory display command (M)* should be separated by a space rather than a comma.

It is not really practical to type TINYMON 1 directly into a Vic. DATA statements in decimal would take up more room than is available in small Vic; and hex entry would need a monitor to be in place already. So I've prepared the program so that it can be entered on a Pet and saved on tape. After it's been created once, the Vic can make its own copies.

You'll need a Pet with Upgrade ROM or 4.0 ROM to do the job, since the Original ROM Pets don't have a machine language monitor and things would get too complicated.

Using TINYMON

TINYMON 1 loads like a Basic program, and copies can be made with a simple LOAD and SAVE sequence as you would do with Basic. When you load TINYMON 1 and say RUN, however, some interesting things happen — the monitor system is repacked into the top of memory, and it will stay there until you turn the power off. You can say **X** to return to Basic and load and run Basic programs, providing they are not too big. TINYMON 1 grabs about 760 bytes of memory, so you lose a little space.

Once you're back in Basic, the question arises: how can you invoke TINYMON 1 when desired? Not an easy trick, since memory is more mobile in the Vic than in the pet. The thing to do is find a zero value in memory and SYS to that location. If you have an unexpanded Vic, SYS 4996 is safe. The sure way is to PEEK first and ensure that there's a zero there (location 10 is often zero).

TINYMON 1 must be considered preliminary. It was designed with two major considerations: to use minimum space, and to load automatically into any Vic regardless of the memory fitted.

The space consideration is fairly obvious: with 3,800-odd bytes available on a small Vic, you want to use up as little as possible. The automatic load feature was tricky to implement; Vic may relocate programs as it loads. What's more, the screen area tends to move around as you add memory.

I scratched my head over the **S** (Save) command. If Vic automatically relocates programs during loading, will a SAVED machine language program be safe? As it turns out, Vic has a new tape format available — when a tape is written, it may be defined as 'absolute' and will not relocate when it loads. This seems the best compromise, but it has one drawback — the Pet won't load this type of tape. Perhaps that's a design decision that will need to be revised...

Finding space

Vic is desperately short of zero page space; machine-language programmers will have to cope with the shortage as best they can. I have used the same locations that the Commodore VICMON monitor uses. There's a difference, however — the Commodore job will swap out selected parts of zero page and put them back later; I don't want to give up the space for that kind of luxury. As a result, you may be annoyed by some locations that are disturbed by TINYMON 1.

For those unfamiliar with the Pet machine language monitor, the commands are:

R — display 6502 registers

Users can use screen editing to type over a display and change the registers

M FFFF TTTT — display memory (from ... to):

Users can use screen editing to type over a display and change memory

X — exit to Basic

It may be wise to type CLR in Basic after exiting

G AAAA — GOTO (execute) address

S "PPPP",0,TTTT,TTTT — Save (program-name, device, from, to)

L "PPPP" — Load (program-name)

There's a delicate tradeoff between features and memory space. There will undoubtedly be other small monitors with a different balance. In any case, I wrote one because I had nothing ... and others in the same position will undoubtedly greet TINYMON 1 with glad cries.

Entering TINYMON

Enter a Pet, using the machine language monitor. Do not try to RUN but follow your entry with the checkup program, Program 2.

First, make the following change:

.. 6028 91 04 14 08 14 05 14 06

Now, enter TINYMON 1:

```

```

The checking program

Whew! TINYMON 1 for the Vic is now entered. Check it with the following program. Type the following direct line on the screen of your Pet.

```

for i=1024 to 2071 step 6: t=0: for k=j to j + t - 1: t=t+peek
ok: next? t;: next

```

You should see the following numbers appear on the screen of your Pet. Check them carefully. Each one represents one line of entry, starting at D400 hexdecimal. If any of those totals are wrong, you've entered the line incorrectly.

```

462 255 506 399 525 541 662 511 (0400)
768 020 755 780 002 610 086 063
801 764 076 840 835 1303 763 0
1422 586 618 720 584 660 535 576
944 672 1130 845 076 1357 1010 1188
1311 052 060 1108 1125 097 809 1021 (0500)
1340 1076 1005 1212 05 982 770 1236
762 1133 1388 052 659 626 1072 803
748 150 617 413 1020 1030 1057 616
944 644 705 631 639 1072 039 1033 (0600)
943 624 1137 670 929 1140 1305 540
054 040 007 620 705 1146 1015 1146
1175 742 064 045 095 860 1004 1042
1235 1202 1355 022 1445 1346 789 1068
1104 1204 975 1306 1339 1160 1165 1210
1340 1204 972 522 460 520 581 942
1010 1079 280 (0600)

```

(The numbers in parentheses appearing to the right won't appear on your screen; they are there to help you locate an incorrect line). When you are satisfied that the program is entered correctly, SAVE it to cassette tape. It may now be loaded into your Vic.

Editor's note: If you don't have access to a Pet, there's a good method of loading TINYMON directly into a Vic that's contained in COMPUTE's First Book of Vic (an excellent compilation of articles from the excellent US magazine COMPUTE!). That article - by one Russell Kavanagh - is a lengthy exposition via a voyage of discovery into how Basic statements work and how TINYMON itself is constructed. The result is a laborious but effective direct-input job that seems to work; highly recommended. ☺

TURN YOUR COMMODORE 64 INTO A PROFESSIONAL MICROCOMPUTER

FIELDMASTER high quality programs are for the serious user of the home computer.

The very latest programming techniques have been used to create clear, easy to use software that must be the finest value available.

We have a program for all your needs - Powerful spreadsheet, full function 80 column word processor, versatile 'card index' database, accounts management, and even logo & poster printer.

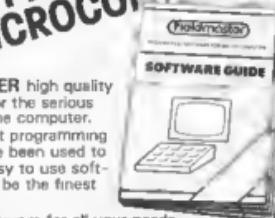

For applications in small business, education, the professions, industry and the home, etc.

Prices from £21.95 to £84.95 inc VAT tape and disk. From your local computer shop or direct from us by our fast mail order service. Access/Barclaycard welcome.

**SIZZLING!
SHATTERING!
sensational!!!
No, but seriously...**

Do you ever find the sharp edge of technology just a bit too sharp for comfort? The *Commodore New Thing* is always going to be more wonderful than the one before, yet somehow we find ourselves swept on towards Next Year's Model without ever getting to use this one the way we intend to.

In 1979 we wrote way ahead of our time. We had the audacity to suppose that people would buy low cost computers because they wanted to use them, not just solder them or program them. It took no stroke of genius to guess that they'd rather pay less for programs that do more. It seemed something obvious that the programs should be easy to use without being limited. And finally though expert in other fields, users would need our help and advice as well.

Well, in 1984 there are still many who want no more from macros than the challenge of impossible odds. We'd no more decency that then we'd knock the *Tutes* crossword or climbing Everest. But we're glad to say that more and more users are appreciating Simple Software and we're proud to say that many of them phone or write just to tell us how pleased they are with the programs they bought. We know you'll recognize value in us. So we'll just drop a few well-known names, and invite you to ask for details of these and more.

Victuals

How we reproduce listings

We have two methods of presenting listings. When we can, we run them through a converter program that replaces the hexographic control codes with more meaningful symbols.

Where you see...	It means...	And you...
[CUP]	cursor up	press the 'cursor up' key (shifted)
[CUD]	cursor down	press the 'cursor down' key
[CRU]	cursor left	press the 'cursor left' key (shifted)
[CRD]	cursor right	press the 'cursor right' key
[BOM]	cursor to the top left and cursor key	press the HOME key
[CLR]	clear	press the CLR key (shifted)
[INS]	insert	press the INSERT key (shifted)
[BLK]	change to black	press the BLK key (CTRL and I)
[WHT]	change to white	press the WHT key (CTRL and I)
[RED]	change to red	press the RED key (CTRL and I)
[GRN]	change to cyan	press the GRN key (CTRL and G)
[PUR]	change to purple	press the PUR key (CTRL and E)
[GRN]	change to green	press the GRN key (CTRL and G)
[BLK]	change to blue	press the BLK key (CTRL and T)
[YEL]	change to yellow	press the YEL key (CTRL and M)
[RVS]	reverse on	press the RVS ON key (CTRL and R)
[RVO]	reverse off	press the RVS OFF key (CTRL and D)
[SPC]	space	press the space bar
		repeat the specified number of times

These listings we generally run out on a letter-quality printer, though, and conventional graphics can't be handled on a daisywheel. So some listings are done on a Commodore printer, in which case you may see the standard control codes:

CLR	• (REVERSED HEART)
RVS ON	■ (REVERSED 5)
RVS OFF	■ (REVERSED 1)
CURSOR UP	□ (REVERSED UNDERSCORE)
CURSOR DOWN	■ (REVERSED 6)
CURSOR LEFT	■ (REVERSED UPWARD BAR = SHIFTED H)
CURSOR RIGHT	■ (REVERSED LEFT SQUARE BRACKET)
SET COLOR TO		
BLACK	■ (REVERSED SHIFTED P)
WHITE	■ (REVERSED E)
RED	■ (REVERSED 4)
CYAN	■ (REVERSED COMMODORE-SHIFTED 8)
PURPLE	■ (REVERSED COMMODORE-SHIFTED 7)
GREEN	■ (REVERSED UPWARD ARROW)
BLUE	■ (REVERSED LEFT ARROW)
YELLOW	■ (REVERSED PI SIGN)
THE FUNCTION KEYS CAN BE INCORPORATED INTO PRINT STATEMENTS TOO, AS WITH THE OTHER NON-ALPHABETICAL KEYS THEY APPEAR AS SPECIAL SYMBOLS IN THE LISTING.		
FUNCTION KEYS		
F1	■ (REVERSED F1)
F2	■ (REVERSED F2)
F3	■ (REVERSED F3)
F4	■ (REVERSED F4)
F5	■ (REVERSED F5)

Welcome to DEALS FOR READERS, a collection of Special Offers from Commodore User Magazine.

This Catalogue offers you excellent deals on Vic and 64 products. Some of them, like the diskovers and the Virtuals tapes, we have produced ourselves. The others are things that we regard as Good Ideas and Good Value, mostly items we reviewed in Commodore User before we decided to sell them. On most of those we have fixed up discounts for readers (while we aren't allowed to sell books at cost price, we can include P&P in our price).

If you want to take up any of the offers, just use the Order Form on the back page. And take a look through the Catalogue even if you don't want to buy now - we'd like to know what you might be interested in seeing in future DEALS FOR READERS catalogues - let us know in the space provided on the Order Form.

DESIGN YOUR OWN VIC SCREENS

CYBERGRAM

£4.20

Brilliant idea, though it's simple really. The Cybergram Designs Vic-20 Graphics Aid Pack is a set of overlays and printed sheets on which you can design your own displays. With them you immediately see the POKE locations you need for display and colour, and you can use successive sheets to set up a specific 'Storyboard' from which to organise and visualise the sequences in a graphics program.

Yours pack includes planner sheets for the standard 22 x 23 screen and plotter sheets for 1023 x 1023 hires graphics using the Super Expander, you also get a set of handy character designer sheets that simplify the construction of your own shapes.

Very neat, very clever - and really useful too. We're sure we can offer the Graphics Aid Pack to you - and a discount on the normal RRP of £4.50.

Deals for Readers

Video Splitters Aerial and computer both on your TV!

This nifty little gadget plugs into the aerial socket at the back of your TV set, and it lets you can have your Vic 64 and the aerial all lashed at the same time.

- No more boring fiddling around to change the plugs, no more unnecessary strain on the wiring!

£1.75

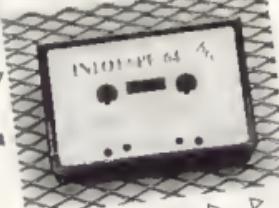

Instant database for your 64

INFOTAPE

Why buy lots of different data storage systems when just one will do? INFOTAPE 64 is a powerful yet easy to use database system for tape users, and stores up to 3,000 data items with you defining the number of fields per record. Totally flexible, and interactive in nature, with the user having command of what data is stored and how. And the characteristics may be changed after the file has been created. Powerfull 19-instruction calculator is built-in (giving spreadsheet capability), batch processor can update or delete all or selected records. A full report generator is included to provide anything from a gummed label for a small shot to tabular reports...

Normal price: £16.95
OUR PRICE: £9.95

Special Offer When you upgrade your system to use a disk drive, we'll send you a disk to retrieve your tape records - and your INFOTAPE order from us comes with a £2.00 voucher against the disk version!

A RECOMMENDED ASSEMBLER for Vic or 64

**Tape: £17.95
Disk: £19.95**

Our reviewer (June 1983) concluded that Elmhouse's C64/65/128 assembler was "good value at the price". So we signed up to sell it.

Fast, commonsense operation, good features and lots of them. Elmhouse reporting what more could you ask of an assembler? Except maybe an editor package.

And - would you believe it - it comes with FREDITOB a general-purpose text editor that can be used for any text (as a mini word processor) and/or create a source file for the assembler. Features save, move, erase, search, instant replace.

£3.99

FALLING APART? ORDER FORM ON BACK PAGE

Our Commodore User binder holds 12 issues of the magazine (and Vic Computing 10, 11 & 12). Dark blue with the magazine's name in gold, smart, sturdy and sensible - the rings are held in by strong elasticated grips, easier and neater than the kind of binder that has metal rods for the purpose. And compare our price with what other magazines charge you for binders!

VICWEAR

Ah, happy memories... our popular collection of good-quality Vic Computing tee-shirts and sweatshirts, all with the characteristic 'Vic Computing' logo. A choice of four witty slogans on the 'Vic Computing' banner will large Tee-shirts in white, blue or grey. sweatshirts in grey State colour and size when ordering - we have small, medium, large and extra-large. We are running low on stocks, though - check the chart on the Order Form for availability

Sticky keytop? Things falling past the keys into the computer? Don't take the chance. When you're not using your Vic or 64, slip over one of our tailored Commodore User dividers - a small black number featuring this magazine's logo or logo. They do keep out dust, but they'll also cope with coffee splashes (anything less than a threeдерспасm in fact!), cigarette ash, the residue of long-haired cats, and the general detritus of daily life. One size fits all!

MATCHING COVER FOR ANY COMMODORE CASSETTE UNIT

£2.00

Keep your cassette clean too, with a matching black cover - effective, efficient.

Compare our prices. How can we do them so cheaply? And we're not compromising on quality. All this, these are some of the best covers we've ever

A GAP ON YOUR WALL?
The Commodore User Poster

£10.95

£1.75

Remember our February cover, with the alligmatic monochrome Renaissance Man looking for the cause of his SYNTAX ERROR? Well we produced a poster version of it - and we have a few left over to fit first 150 lucky customers. Printed by thermal colour on glossy high-quality paper, A3 size (about 16" by 23"). Just the thing for your bedroom/clubroom/computer room wall...

WEAR YOUR MAG!

Commodore User t-shirts and sweatshirts are in good-quality cotton, ideal for late nights in front of the computer or the beach at Torremolinos or the lounge bar at the Pig and Whistle. Cobalt blue, with the magazine's logo big and bold across the chest. State size when ordering. We have small, medium, large and extra large.

A Bigger Basic: The DEF function

Getting more out of your programming

by Chris Preston

An occasional series in which Chris looks at the less well explored regions of Commodore's Basic - there's more to Basic than you'll find in the beginners' handbook!

This time he looks at one of the most under-used and ill-understood features of the Basic language. The DEF FN statement may be under-utilised: yet it is tremendously useful, especially if you have a lot of calculations to do.

The 'User-Defined Function' (as it is known) is just as useful and for many of the same reasons as a GOSUB, and how many people could do without that? Many people do buy computers to perform complex calculations, but never overcome their fear of this quite harmless statement.

Let's look at an example of when we might use the DEF FN statement. The formula for the area of a circle is...

AREA = PI * RAD * RAD

where RAD contains the radius of the circle and PI holds (you believe) the value pi. (Notice that it is often quicker to write RAD*RAD than RAD².)

Now we might have a number of equations where the expression PI*RAD*RAD is needed, such as:

**CI = PI * RAD * RAD + 2
VOL = PI * RAD * RAD * L**

Sooner or later you're going to get tired of typing PI * RAD * RAD; so what can you do about it? Well you could use a subroutine:

**100 GOSUB 1000
110 CI = I + 2
120 GOSUB 1000
130 VOL = I * L**

**1000 I = PI * RAD * RAD
1010 RETURN**

But now what happens if we have two more circles, of radius R1 and R2? So we write two more subroutines:

**1000 I = PI * R1 * R1
1100 RETURN
1200 I = PI * R2 * R2
1210 RETURN**

... And what do we do with this equation?

**AT = (PI * RAD * RAD) +
(PI * R1 * R1) + (PI * R2 * R2)**

Of course, it can be done with subroutines; it can even be left just as it is - it will work after all. But there are many more complicated equations than that you might use.

We really need some kind of solution which has the same advantages as a subroutine, namely that the code only has to be written once - which saves memory, and makes it easy to change every use of the code by changing the subroutine. And we'd want it without the disadvantage that subroutines do not fit well into equations, as we have seen.

Enter DEF

This is where the DEF FN statement comes in. We can rewrite that horrible equation for AT like this:

AT = FNA (RAD) + FNA (R1) + FNA (R2)

You can use that variable now whenever you want - and it's a vast improvement on a subroutine system, to be sure. So how does it work?

We are looking at 'user-defined functions', so before we users can use the functions, of course we have to define them! Shaking to our example, let's define a function to calculate our area.

10 DEF FNA (I) = PI * I * I

What does this statement mean? It starts with DEF FN, short for 'DEFine FuNction'. The 'FNA' is the function name and it follows the same rules as variable names so you can

have several functions with the definition of the function being fixed, as with those trigonometrical functions, we ourselves decide what the function is to do.

We have now shown that the user-defined function does in fact give us the advantages we asked of in that the code (the function definition) is only written once, so we can change every use of a function just by changing the definition once. In addition, being a function is fits quite neatly into equations.

The power of the user-defined function lies in the dummy variable (although I have used T here, any variable name could be used). It is important to realise that this T is not the same as any T used in the program. When we use the function, like this for example...

A = FNA (RAD)

... the value of RAD is used wherever T appears in the function definition. This process is called the substitution of an **actual parameter** (RAD) for a **dummy parameter** (T). So if we say:

A = FNA (RAD)

... the equation becomes...

A = PI * RAD * RAD

If we say:

A = FNA (R1)

... the equation becomes...

A = PI * R1 * R1

We can even use an expression as the argument of the FNA function:

A = FNA (2*RAD+1)

... which gives the equation:

A = PI * (2*(RAD+1)) * (2*(RAD+1))

So you can see that a user-defined function would be employed in equations in the same way as built-in functions like SIN or TAN. But instead of

the definition of the function being fixed, as with those trigonometrical functions, we ourselves decide what the function is to do.

We have now shown that the user-defined function does in fact give us the advantages we asked of in that the code (the function definition) is only written once, so we can change every use of a function just by changing the definition once. In addition, being a function is fits quite neatly into equations.

But you can only have one dummy variable (such as the T in those examples). Any other variable mentioned in the function definition (such as PI) is a real variable, and it will have the value it has in the program when the function is used (not when it is defined). For example:

**10 K = 15
20 DEF FNC (W) = 10 * SIN
(2 * W + K)
30 K = 0.1
40 PRINT FNC(0.5)**

When FNC is evaluated in line 40, 0.5 is substituted for W in the function definition in line 20. K is a real variable, of course, but it has the value 0.1 and not the value 15. Line 40 has the same effect as

PRINT 10 * SIN(1.1)

The second restriction is that you can only define numeric functions: the value returned by the function must be a number, not a string. You can not, for instance, say

**10 DEF FNA\$(I) = MIDS
(A\$, I, 1)**

Apart from these two drawbacks the user-defined function is a very powerful tool, and deserves to be used much more often than it is. ♦

New for your CBM 64

Sunday League Cricket simulation game

HIT AND RUN

30 players to choose from giving thousands of different permutations for team composition. One or two player game (in fact the whole family could join in to decide tactics etc.)

Sunday league rules:- 40 overs per innings. Bowlers are limited to eight overs and may not bowl more than two successive overs.

Conditions very from match to match. Wides, byes, no ball, etc included.

HIT AND RUN

cassette £7.95 (plus 50p PP)
disk £9.50 (plus 50p PP)

Send S.A.E. (marked '64') for full lists of 64 software (Leisure, Educational and Business).

BYTEWELL, 203 COURT ROAD, BARRY, S.

compuSET

a nice place to visit?

Network

Being the continuing story of a young (well, middle-aged) man's love affair with a modem...

by Karl Dallas

The story so far: our hero has obtained a pre-production sample of the Commodore 64 modem. He has explored the farthest reaches of Prestel and Micronet until he's seeing square lo-res graphics in front of his eyes; he's tried (unsuccessfully) to access the American CompuServe Database in Ohio; and he's managed (with some difficulty) to pay his phone bill. Now read on...

The thinking behind the new Commodore 64 modem is delightfully simple, when you come to think of it: not only to sell a simple, comparatively inexpensive device which plugs straight into the phone lines and makes microcomputers/telecommunications almost as easy as turning on a light switch, but also to establish a powerful new database that succeeds where Prestel and even Micronet have so far failed.

In short, the people at Commodore want to catch the imagination of your average micro hacker in a way that demonstrably hasn't happened yet.

The 'wired society' is a great conceit when you shod it on a Whitsun press release or hear it in the Prime Minister's speeches. But with members of the public not signing on fast enough to make being an information provider anything more than an expensive tax loss - and Prestel's droppings out like the proverbial fees - it clearly needs some kind of shot in the arm, before it becomes more than just a gleam in Margaret Thatcher's steel-blue eyes.

Commodore is ploughing to give it that shot. But, typically, Commodore is not doing it in an orthodox way.

CompuSET is Commodore's sit-up-and-be-got information service. It is expected to be available to all you people out there in computerland some time in September (if nothing goes seriously wrong between now and then). And it will ignore Prestel entirely.

It's a strictly go-it-alone service, which will stand or fall on how many people buy the

£99.99 modem and become free (for the first year, at least) subscribers

Teleshopping

One of the main advantages of Prestel should be the fact that if you use it to do your teleshopping, then the costs of what you buy can be charged to your quarterly Prestel bill. In practice, many companies on Prestel ask you to send good old fashioned paper stuff like cheques; at the very least they need you to quote a credit card number before they will do nicely for you. You can't even join ICPUG (the Independent Commodore Products Users' Group) electronically - though that's because ICPUG gets its pages free, and it isn't allowed to do serious business on the screen.

When you join CompuSET,

though, you also have to sign a direct debit authorisation. That allows them to bill you at the bank and to receive payment with no further action on your part: a little risky, if you're an impulsive purchaser like me, but from CompuSET's point of view it sure beats waiting 90 days for the money.

And, as evidence that they're aiming to take on both Prestel and Micronet at the same time, CompuSET will be extending the service to owners of other micros besides Commodore's or so a little bird tells me, though I won't expect to see that before mid-1985.

On-line

A few lucky folk (including your humble servant) have been given privileged access here and now to see what a Good Thing CompuSET is going to be

Before I could get on to CompuSET, I had to swap the Viewdata chip on my modem - which meant I won't be able to get Prestel again until they get round to writing the new disk-based Viewdata software. I was allocated a user number and password, and I had to promise faithfully not to go on about all the hints that don't quite work.

If you get shown round a half-finished building you wouldn't be horrified if the lifts don't work, and you might expect to find a lot of dust and builders' rubble around. So I wasn't at all amazed to find signs of work in progress all over as I browsed. But it's sure going to be a nice place to visit when it's officially opened.

The first thing I liked was the fact that dialling was easier, especially if you don't get through first time. The command CONNECT (or SHIFT/C for short) produces a number prompt, after which you can type in one of the 12 telephone numbers that will reach the computer nearest to you. In my case that was 01-837 3492, since I'm in London (there's a second London computer port in case that one gets too busy). The others are in Andover, Birmingham, Bristol, Edinburgh, Glasgow, Leeds, Luton, Newcastle (upon Tyne, I assume, though the documentation doesn't say), Leicester, and Warrington.

If you can't get through, the computer remembers the last number you've dialled; it will try again if you press RETURN - and it'll continue to do so until you switch off, as a matter of fact.

Modern memory

Then comes one of the nice parts: CompuSET takes about 13K

of memory at your end. There's 8K in the Computer modem, the other 8K comes from the host computer, which quizzes your 64 to see if it has the full 13K and downloads the extra code if you haven't got it on board. You can then save this to disk (with the special command CN\$AVE). So next time you can LOAD it directly (the command is CN\$LOAD, as I expect you guessed) before getting on line to the host computer - thus saving phone time and money.

If the 8K bit has been updated since you last dialled in, the host computer checks its latest version with what you've got in memory; and if yours is a bit older it's updated automatically. That'll make communal enhancement a really valuable feature, with absolutely no hassle to you or me.

The next thing I liked was what the people at CompuNet call the "shockshot" menu, a list of possible commands along the bottom of the screen. The original idea was to have these

moving slowly across, past a highlighted window you'd have about two seconds to hit RETURN and get the option you wanted. They decided this was a bit chancey, so now the menu runs to left or right past the window when you press the left and right cursors - a sort of continuous loop, so that as a command goes off one side of the screen it re-enters on the other.

One of the commands is 'Help'. Much of the 8K extra memory is taken up by very comprehensive help screens at every level of menu, those are downloaded with the system software.

You can get a diskcheck menu even without logging on, if you type 'EDIT' (or SHIFT/EDIT) from the opening screen, because you can edit messages off-line or on-line

In the Jungle

Uploading of members' screens (which may be software or just noiceboards) into what's called

the jungle is one of CompuNet's special features. An average charge of 1p per kilobyte or per frame per day will be made, with a maximum charge of 8p, and you'll be able to charge people who download your software. At the moment this is little more than a couple of rather nice graphics screens (I like the logo especially) - hardly surprising since the service isn't even public yet.

There's also Software Park for downloading commercial software (including the Viscom range), and Mailbox for sending and receiving electronic mail.

Having accessed America's CompuServe more successfully since my last report, I must say that CompuNet is a much more friendly service. The American is much more professional-looking, with pages of info scrolling rapidly up the screen at you; but that makes it rather forbidding as well. The biggest plus for the Americans is the standard of technical questions and answers you can eavesdrop on, which is

several cuts above the "why do I get those funny characters when I press a cursor after a quotes sign?" queries you get in so many British mags. But CompuNet promises to be a lot more friendly.

Anything I didn't like? Well, it was my impression that getting screens up was a little slower than on Prestel, and if the entire product lives up to the promise of the sample I've observed so far, it'll very quickly become a force to be reckoned with in the micro world.

PEEKs and POKEs with AND and/or OR:

The basics of Bit Switching by J Cundell

The Commodore 64 is exceptional value with its excellent keyboard, stacks of memory, the best sound chip in the business, sprite graphics and extremely flexible operating system. Or rather, it is good value – if you are capable of keying in the incredible amount of POKEs and PEEKs required to access most of the goodies that this best selling machine has to offer. But the problems don't stop there: enter the wonderful world of Bit Switching to make the most of those PEEKs and POKEs.

The handbook which accompanies the machine is dreadfully inadequate. So if you intend to do more than play games or run other people's programs, it will not be long before you start hunting the shelves of your local computer dealer for more practical information.

The Programmer's Reference Guide will no doubt be your first port of call. This certainly contains all the information that you need to become a proficient programmer; but it assumes a more than average knowledge of Basic. Other books have therefore hastily filled the gap – one or two are excellent, some average, quite a few are considerably worse than useless.

With perseverance and some hours at the keyboard, however, you can reach the stage where your programs can become useful and worthy of exposure to others – especially for sexual software.

But as soon as hi-res, graphics and sound are attempted, things become horribly complicated. You could resort to Simon's Basic or one of the many graphic ads now available; the disadvantage with these utilities is that immediately they reduce markedly the acceptance of your software to only those other users who have this specific package. Otherwise, you must be able to use the dreadful Basic 2 commands with confidence.

Most of the commands are adequately explained in the literature and with patience their application will be understood. I have struggled with this problem for nearly six months now and the light is beginning to shine through. I managed to clarify most of my difficulties by diligent investigation and good old-fashioned key-bashing.

My biggest problem was trying to find out what was meant by something like ...

POKE 53265, PEEK(53265)AND 191

– or –

POKE 53270, PEEK(53270)OR 16

These statements are used regularly in published programs and in the manuals and books covering the Commodore 64, but nowhere could I find an explanation of how the commands actually worked.

Only since my decision to delve into machine code has the penny dropped, but had I known what was happening before, things would have been much clearer during my attempts to switch locations in and out on the 64's memory map.

For that is what the two statements are all about: bit switching. And if you wish to

gain full benefit from the exceptional flexibility of the 64 then it is imperative that you fully understand the logic of these commands.

A little byte first

Your 64 consists basically (sorry) of over 64,000 memory locations that are used by software which is either pre-programmed into the computer in the form of Read Only Memory (ROM) or it's code that you enter through the keyboard or from some outside storage source such as tape, disk or cartridge.

A number of these memory addresses or registers are put aside by the manufacturer to have special functions – for instance, to switch on or off sound channels, video banks, input/output devices

One of the major advantages of the 64 is that these locations can be manipulated and different functions accessed by the programmer. Before we look at how to carry out these operations, though, it will be necessary to take a look at how the memory addresses are built up. Any one address or location consists of one byte, and as most of you will know a byte can store numerical values. It does this by switching on and off its bit positions: each byte consists of eight bits or switches, and each one of these bits represents one binary digit.

Now, there is not room here to discuss binary nomenclature in detail, such information is available in any introductory textbook on computer programming. But in short, binary is a number system which uses only two digits, 1 and 0; and any number can be represented in binary. Inside the computer bytes, the binary numbers are represented by pulses of electricity with a pulse for 1 and no pulse for 0. A bit can therefore be on or off, 1 or 0. Hence, any byte's value can be represented by the eight switches. For example, binary 00010001 represents 17 in decimal. (As this system only uses two numbers, 0 and 1, it is known as binary.) Of course, our normal numbering system is based on 10 numbers, 0 to 9, and is therefore known as decimal.)

The location of the number coming from the right-hand side provides the power of 10 by which each digit is to be

multipled. Let us take an example decimal 1224

1 2 2 4 decimal
3 2 1 0 location

$$1 \cdot 10^3 + 2 \cdot 10^2 + 2 \cdot 10^1 + 4 \cdot 10^0 = 1224 \text{ power 10}$$

or to put it another way:

$$1000 + 300 + 20 + 4 = 1224$$

The result of a binary computation is determined in exactly the same manner except that the location of the digits counting from the right hand side determines the power of 2 by which each number is to be multiplied. Let's take a look at a binary number and examine how it breaks down into decimal -

1 1 0 1 0 1 1 0 binary
7 6 5 4 3 2 1 0 location

$$1 \cdot 2^7 + 1 \cdot 2^6 + 1 \cdot 2^5 + 1 \cdot 2^4 + 1 \cdot 2^3 + 1 \cdot 2^2 + 1 \cdot 2^1 + 1 \cdot 2^0 = 256 + 128 + 64 + 32 + 16 + 8 + 4 + 2 + 1 = 256 + 256 = 512$$

Switching

If the above makes sense to you, we're now in a position to return to the original discussion of switching these various bits within bytes.

Why should we do this? Well, each of these individual bits within a byte actually acts as a switch in its own right and various combinations switch on or off the special functions previously mentioned.

For instance, take a look at address 53272. The upper four bits of this address control the location of the screen memory, which can be moved to anyone of 16 different locations plus the one that is automatically selected on powering up the 64.

If that is not complicated enough, bits 1, 2 and 3 control the location of the character memory.

Bits are labelled from right to left in accordance with their numerical power as in the table, in other words 0 to 7. So to set bit 4 of an address to 1, that is, to turn it on - you can POKE the

byte with decimal 16 (2 to the fourth power). This POKE clears the whole byte and replaces it with a 16, or in binary, 00010000.

The problem is that practically all of the system control bytes in the 64 carry out a variety of operations as we have seen with 53272. And in many instances you will want to be able to switch on or off a specific bit without affecting any of the other bits. Obviously it will not be possible to do this by POKEing a single decimal number. But this can be done by using the OR and AND commands.

The OR command

This statement or keyword examines each individual bit of the original byte and compares it with the corresponding bit of the OR byte. If one or the other of the bits is on, that is a '1', then the resulting byte will be given a 1 in that specific bit. If neither of the bits is on, the resulting specific bit will be a 0.

Therefore, if we wished to change bit 4 to a '1' without

changing any of the other bit settings within a particular byte we should POKE 53272, (PEEK(53272)OR16)

The AND command

AND behaves in a similar manner. It examines each individual bit of each byte and compares it to the corresponding bit of the AND byte, this time it sets the bit on only if both the first bit and the second bit are '1's.

Let's take the original byte as 00011111 or decimal 31.

Original address 00011111 = 31
AND with 236 11000010 = 236
Resulting byte 00000010 = 2

So therefore ANDing 16 with 236 clears bits 0, 2, 3 and 4. This would be written as

POKE 53272 (PEEK(53272) AND 236)

Armed with the means to carry out these operations you will find the Commodore 64 to be a very amazeball and powerful machine.

Singalong-a-Summer

by *Diego El Sid*

Wherever you go on holiday this summer, whether you're riding the waves at Malibu, horse-riding in the Sierra Nevada or just soaking in the sun at dear old Friant, there's one tune that's guaranteed to put you in that sing-along holiday mood. We present it here in all its glory.

Lures 200 set up the Commodore 64's SID chip (using all three voices) and a routine for reading data statements. So you could write your own tune by using this last half of the program as a base. In fact you need line 2000 whenever data statements you provide of your own.

It is more fun when the camp is kept orderly and tidy

Using the 64's

The Commodore 64 User Manual briefly mentions the four function keys on the right hand side of the keyboard, suggesting that they can be defined in many ways to handle repetitive tasks. After this encouraging news it is disappointing to find no further reference to them. Even the programmers' Reference Guide is uninformative on the matter.

The fact is that the keys are merely spares and have no set functions at all ... unless the user is prepared to write a program to drive them.

The program described here will do just that. It enables you to define a statement for each key, which will be printed on the screen whenever that key is pressed. The purpose is to save the effort of typing in frequently used expressions such as ...

```
POKE 33281, (PEEK(53281) + 1)
AND 15 (RETURN) and PRINT
FRE(0) - (FRE(0) < 0)^45536
(ENTER).
```

Now, a job like this is simple in Basic: we just instruct the computer to expect a key entry, check if it is one of our function keys, and jump to a program line carrying the desired command. But this is of no use to us for editing purposes because it

requires a program to be running continuously and awaiting a keyboard entry.

What is needed is a program that works while the Commodore is in direct mode; that means we must use the interrupt facility, and therefore we must employ machine code

Interrupts

It will be worthwhile to digress briefly to explain these 'interrupts' for the benefit of novice machine-code programmers. Sixty times a second the operating system leaves off from whatever task is being performed in order to carry out a few checks on the inputs and outputs - for example,

scanning the keyboard to find out if a key is being pressed.

Although the routine which carries out this task is in ROM and cannot be changed, the address (or 'vector') is in RAM. A user interrupt simply changes this vector to point to a location of the user's own choosing; control is returned to the regular interrupt upon completion.

I wanted my Function Key Definition program to contain the following features:

- Entering of defined statements via the keyboard, with the opportunity to re-define as and when the need arises
- Editing of defined statements on entry

- Use of shift and quotes modes
- Execution of command statements automatically
- At least 40 characters per statement
- 'Portability' across memory spaces to avoid clashing with the program being written

The first items are dealt with by taking advantage of the CHDN routine at F7CF hex (8845 decimal). Since the keyboard goes 'dead' during user interrupts, this routine is best called by means of a SYS command in direct mode.

But continual use of SYS commands by hand can lead to problems if errors are made, so the program prints the SYS statement on the screen from

Function keys

by John Rampling

within the interrupt. It works like this:

- **Function key pressed (or SHIFT + key)**: the previously defined statement is printed on the screen.
- **Function key + CTRL key** (or CSM key to define a shifted key): the SYS command is printed on the screen to call the CSM routine.

The CTRL key enables definition of keys F1, F3, F5 and F7. The CSM key (or the CTRL + SHIFT keys) handles F2, F4 and F6.

If you have already run the program before reading this far, you may be wondering why the SYS command does not appear on the screen. In fact it does appear briefly (for about 1/4 second) but is instantly overwritten by a message inviting input of a key definition.

Item 4 on my list of requirements is met by using the left-arrow symbol to represent Return. The program checks for this symbol and converts it to CHR\$(13) whenever it is encountered (for that reason it can not be used as a graphics symbol in your key definitions).

The characters you want are typed in, up to a maximum of 84, and entered by pressing RETURN. Do not exceed 64 characters - the computer will suppose you have started afresh and ignore the first 64! It's easy enough to tell when you have reached the limit: the cursor will have reached the end of the second line of print on the screen.

The characters you want are then saved in the portion of memory reserved for the particular key, and finished off with a zero to mark the end. Depressing the appropriate key will thereafter print the characters by copying them from memory into the keyboard buffer, to be transferred to the screen on exit from the interrupt.

The problem ...

And here lies a problem. The keyboard buffer has room for only two characters, and any attempt to put more into it will put the risk of corrupting important data in the bottom 1K of memory.

This can be overcome by copying the contents of memory into the buffer ten characters at a time, returning for the rest at the next interrupt when the keyboard buffer has been emptied. This

involves setting a 'flag' to remind the program that characters are waiting in the queue.

To operate, load the Basic loader program and RUN it. You will be confronted by a menu of options to permit you to select the memory location in which you want the program to reside. Unless you are using the program to assist you in writing machine code programs, I would recommend Option 1 which places the routine at the top of the 4K RAM buffer where it is out of the reach of Basic.

When RUN, the program decides itself to leave a clear area for your new program. The machine code routine remains, occupying 3 to 4K of memory starting at the location you have picked.

The loader

The Basic loader is fairly self-explanatory. The main business is carried on in lines 200 to 280 in which the DATA is POKEd into the memory location chosen, and a section of memory is set apart if it is decided to use part of the Basic program space below 4096. By all means experiment by changing the variable A to allow use of other locations as desired.

The assembly language version is shown for the interest of machine-code fans. The values assume a starting location for the program at C200 hex. But the vital JMP statements are liable to be altered in the Basic version if a different starting place has been picked; so don't be alarmed if a disassembly of the finished program is not identical.

One final point of importance. When the interrupt vector has been changed in the manner described earlier, there is a likelihood of things going wrong when you try to use the cassette player to load or save programs. To avoid problems, always press the RUN/STOP and RESTORE keys before using the cassette player. Alternatively, and less drastically, restore normal interrupts by entering ...

POKE 788, 49: POKE 789, 234: SYS 679

and re-enable your Function Key program afterwards with ...

POKE 788, 0: POKE 789, A+2: SYS 679

... where A has the same value as the variable A in the Basic program.

Ok, let's try it ...

Assembly language listing

Games

ASTRAL ZONE

Joystick only

Price £6.95

At first sight this game appears to have a lot to offer. It's a 3D battle game in the Battle Zone mode, in which the player has around being attacked by beefy nasties - when one of them crosses your sights, zap!

The game continues like this, with the player amassing points for each kill until a total of five nasties manage to hit you. Sound effects are okay and there are two-player and high score features.

If this were the first sheet in a multi part game, it would be quite sufficient; however the limited range of chunky attackers and the boring view of triangular mountains in the background won't hold your attention for long. Sorry, Channel 8 but this one gets a thumbs down. It very quickly becomes monotonous. DW

ALIEN RESCUE

ALIEN RESCUE

Joystick only

Price £9.95

It's a funny thing the blurb on the cassette and card portrays exactly and fully what actually happens. Amazing!

You are required to ferry your fleet's survival raft fleeing from their latest tour taking them from the enemy planet back to the

SCREEN SCENE

chunky moon cargo mother ship while audibly avoiding collisions with yet more capsules still falling from the sky. You are also cordially invited to exchange fire (with a very mobile cannon) provided you are not currently carrying cargo. Naturally the preceding space battle was of mega proportions so you are consequently shouldered with an unenviably and unmentionable rescue mission.

Not a complicated convoluted video experience, mostly a simple wall worth formula adequately implemented, allowing nine levels of difficulty. Run-of-the-mill background sounds with a blip for a successful grab. Extremely unlikely to hold you spellbound, but if you fancy something straightforward for a change check out the insert.

BATH TIME

Joystick only

Price £7.95

Described as a 'family' arcade game this obviously misses the main market especially as two joysticks are required and violence is eschewed. The game still offers a contest and friendly rivalry between players (the one player option should really be considered as a practice run).

The Trout Quintet (Schubert) and the Dying Swan by Tchaikovsky mellifluously complement the pastel colour scheme to produce a peaceful atmosphere. Perspective graphics are employed in depicting a square pool containing a swan and a fish. If the water level rises high enough the swan swims away along a run-off too low, and the fish pensively. One player turns on the selection of tapa while the other opens the corresponding valves trying to maintain

an equilibrium. Complications arise when an elephant siphons off water or a boy with a pen pours some in.

That's it, apart from pre-selectable skill and speed levels. But graphics and sound are good this program may well appeal to the more civilised amongst us. LS

BIONIC GRANNY

Joystick or keyboard

Price £1.95

The trouble with bargain-basement games is that you're loathe to criticise them - you pay so little for them, as they say. Given that caveat, this game is still prettyousy. The scenario is rather patently too.

You're a granny, wanting to hit children with your 'laser-powered broom' as they come out of school. The only danger you must avoid is a lollopip person who throws his or her lollopip at you. The game is obviously designed for young children but that cannot excuse the dire lack of playability, the rudimentary graphics and the calamitous grammatical mistakes in the on-screen instructions (argh!).

BLACK HAWK

Joystick only

Price £7.95

Imagine a game of Skirmish and you're way towards visualising this. Apparently there is a sophisticated electronic packed into a decent bonnet as the onboard you get to hog the controls, which enable pressing a bomb (attack mode) will launch and a reversible stick a refined depiction of armoured, missiles, tanks, gunships and intelligence modes allowing Black Hawk ready to spot out capsule shells. You let them fly alongside the edge of the screen while in attack mode you are immediately switched to defence mode.

Accurate bouts of levitation are rewarded by enhanced weaponry and superior which enables the detection of various enemy command posts. You will no doubt enter the cockpit prepared to smash your way through all eight levels.

Typical tap-and-dodge action now with that in hand than a veneer of refinement. There is a surge of interest with each level as new targets and paraphernalia present themselves. Graphics are fair but the sound effects are Wagner and Wagner.

It was not an easy price to pay an awful game. I can't believe in the price tag. After all what happens when the dog chews? Up and you can't recall what key words a smart bomb?

The 64 ought to be an excellent computer for games - and fortunately some suppliers are indeed taking advantage of that. Others aren't. Here's this month's crop of reviews.

How do we assess games? Basically we play them - which may sound obvious, except that all the reviewers have seen so many games that they can apply a bit of comparative experience to the evaluation.

We rate games out of five for each of four criteria. **Presentation** means how well the thing is packaged and how good it looks on the screen: dull graphics and poor sound get marked down here. **Skill level** refers to how much skill (of whatever kind) is required to play the game - so if pure chance is involved, the game gets a low mark. (But don't dismiss it on that: some 'chance' games are great fun.) **Interest** is an answer to how well the game did at maintaining the reviewer's interest in it. And **Value for Money** is obvious enough: it's our overall conclusion about how it compares with other games and whether we'd buy it ourselves.

BMX RACERS
Joystick or keyboard
Price £1.99

For the price, this is a surprisingly good and fairly original game. You're riding a motorbike through a park, trying to keep to the track whilst avoiding various hazards and another maniac biker who comes in and out of the on-coming traffic totally immune to danger, just like going up the A1 Veer off the track and you're dodging

WAS IT EVER ROME?

MAX RACERS

199

through trees and shrubs. That's it really - the points total mounts up the further you get.

Graphics are pretty rudimentary, though, the 64 is capable of much more. Your bike doesn't really look like one and, unless you read the blurb, you wouldn't guess that one of the hazards is a granny throwing a stick at your wheel. There are no engine revving sounds either, just a discordant noise better turn the sound down. Despite all that, manoeuvrability using a joystick is impressive. Definitely good value for a few hours.

GT BURGER CHASE
SUPERSOFT

BURGER CHASE
Joystick or keyboard
Price £6.99

How on earth did they think of this one? Loosely based on the Pacman formula, but nevertheless different and abstract enough to warrant the epithet 'original'.

The constituent parts of four burgers (i.e. bun, meat and garnish) are stationed on different floors of a restaurant. The chef has to collect these by ascending ladders and trampling them down to the floor below, eventually to collect the bottom, charred remains. Mayhem occurs.

Once assembled - you're at the end of level one. But hang on bar razzing the chef are (wait for it) sausages, fried eggs and pickles. With nothing but his meatey agility and trusty pepperpot it's a close-run race for our friend - especially as the seasoning condiment is in short supply. Extra points can be achieved by squashing the wierdos and by grabbing the odd faultless bonus objects.

Four different screens with good sound effects and a couple of surprises thrown in. Quirky enough to please anyone on the lookout for something different - and definitely not junk food.

BOOGA-BOO
Joystick only
Price £7.95

Manoeuvre Booga-Boo the jumping flea to the top of the cavern, avoiding the flying dragon and the Venus fly-traps. You can jump to the left or to the right; the longer you keep the joystick in that direction the further you will jump.

The game sounds simple, but in fact it is very difficult to play. I couldn't escape once. The dragon seems to home in on you - and it is very partial to eating fleas. And the fly-traps are positioned so that if you don't judge the strength of a jump correctly you fall in.

The graphics on this game are wonderful, mushrooms, plants, ledges, everything is very well represented. The continual tune on the other hand is all right the first couple of games, but after that it gets annoying.

One gripe about this game is that it is preceded on the tape by a title-page program which serves no purpose whatever. Why couldn't the credits have been put in the insert? But if you want a lasting challenge and don't mind being frustrated as you hit the dust again, this game is for you. Otherwise, I suggest you can find easier and better games.

IC

choose any colour plate, but on the second screen you are told the colour of the plate and you must find one of that colour. I didn't get past this.

The graphics on this game are good, the planes really spin, and your Oriental man is very well represented, complete with one of those Chinese hats. The sound is restricted to a continual tune, which might be quite good if it wasn't slightly off pitch (or my machine anyway).

Although it takes a while to get the hang of this game (perhaps the instructions could be better worded), I found it curiously compelling once I figured it out. Recommended.

COSMIC BOUNCE

Joystick only
Price £7.50

Both the title and cassette illustration strongly imply a space game, but without the aid of a vivid imagination to most it would appear as a 'bouncing ball derivative' - a sophisticated super-version of the familiar 64 handbook example program.

The notion is good a power source is shuttling (bouncing) back and forth between two bases and, yet again, aliens are out to claim it for their own. Defend it if you must. Taking note of the two auxiliary rebound posts near the centre stage and the far corner springboards, you unleash a plasma bolt. Now, this projectile destroys everything in its wake (except of course the pane) so once an invader has been crushed the best policy is to recapture it before it rings all over the place and obliterates your 13amp socket. Different alien types engage your attention and the defectors become mobile. Just to make things more interesting, the latter are show stoppingly lethal to touch

CHINESE JUGGLER
Joystick only
Price £6.90

Your turn to be the juggler! You must take plates from the plate-track and set them spinning on the eight rods. As they show signs of flagging you must rush round to refresh them - until finally you have got all eight on the rods, when you go on to the next screen.

On the first screen you can

NEW ORIGINAL GAMES FOR THE COMMODORE 64

• **NIGHTMARE PARK** is in fact a compendium of 14 games. The task of the user is to gain as many points as possible travelling through a maze beset by obstacles of every turn. These infuriating obstacles are overcome by a combination of skill, sharp reflexes or by sheer good luck making Nightmare Park a suitable game for all ages.

PRICE £7.99

• **DOTS & BOXES** is an intelligent game where the user and the computer take turns in completing boxes by drawing a line between two dots. The aim of the game is to win the most boxes whilst skilfully minimising the number of boxes given away to the computer.

PRICE £6.95

• **CHOPPERLAND** Your chopper is chartered to transfer goods from your base and land SAFELY. An exciting new game full of surprises.

£7.99

1 VOUCHER

• **HEXAPAWN** For strategic and persistent play. The opponent (computer) has no initial strategy but is programmed to learn from the user's wins to improve its own strategy.

£5.95

Games

though you may use some of your time in running the intruders

Enjoyable to play, and you'll agree it is different. But how much better it could have been, say with really outrageous multi-colour nasties and a plausible space ship. The only sonics I can recall are re-bounds and pulses, which is fair enough. Not so acceptable however is the erratic collision detection, several times I was penalised for catching the plasma ball. There's a bug in there somewhere

DEATH STAR

Joystick only
Price £5.99

This program utilises three-way scrolling and simulated shadows to give the impression of 3D rather successfully. Star Wars devotees are given the opportunity to play the leading role (no, not the princess) (why not - Ed) and fly along the trench of the battle planet Death Star.

None of the undiluted blast-on-be-blasted combat, featuring classically designed interceptors hurtling towards your large fighter. You may unleash only common-or-garden laser bolts. Beware of their unpredictable, unstoppable, pulsating missiles, and don't crash into the sides when taking violent evasive action. No way are they sitting ducks... let's just say you have to be very nippy.

As the main colour scheme is black and grey, the TV controls will need to be set up just right. Nice graphics, though, and typical battle sounds but with scene-setting organ music on the title page. I suggest that you take a look at this little number at a micro shop near you.

SUPERSOFT
3-D
Glooper

All-action
maze
game

3D GLOOPER

Keyboard or joystick
Price £8.95

Essential equipment for rugby man munchers. I should have thought. A fast-response 3D maze beep-pannered with blue tokens which you gobble up as you race round the streets a few red ones too, with the power to turn the vicious brown Gloopers into a vulnerable orange. A sensor display indicating the proximity of tokens and monsters aid in the hunt for the 300 or so necessary to exit to the next level. As a 3D maze is more difficult to negotiate than the normal, it's just as well the grim galloping gourmets aren't too intelligent.

Plenty of pink brick walls, dead ends and long grey vistas of course. Padding feet, to warn of imminent danger, are the main sound effects. Certainly unusual but don't blame me if it makes you dizzy! LS

ENCOUNTER

Joystick only
Price £5.95 tape, £12.95
disk

So you're getting pretty sick of arcade games? Bored with flying a spaceship through a barrage of nondescript nasties? You need a revitalising tonic. Playing Encounter may just provide that pick-me-up. It's a true three-dimensional combat game.

You use the joystick to move in any direction through a barren landscape scattered with huge black pyramids - rather like a Salvador Dali painting. The screen is actually the window of your ship. Pyramids look large and recede into tiny specks as you move back wards and forwards or weave in

and out of them.

But the idea behind the game is lamentably rather threadbare: you hunt out and destroy the flying saucers that roar around.

A radar scanner at the bottom of the screen helps you track them down. Needless to say, the saucers also fire at you. And missiles appear occasionally – although you don't know who or what fired them.

You can duck behind pylons but they won't guarantee you safety. Pyramids will stop the saucers' shots but smart-Alec missiles go round them, boomerang off them and can get you on the rebound. Four hits to your craft and the game ends. Destroy all the saucers and you move up a level into even more weird and wonderful scenery. **ES**

HUNTER

Joystick or keyboard
Price £3.95

A simple but compelling game. You are pursued by six robotships around the screen: if you manage to shoot them all, on the next screen they become faster and more intelligent – until it's a frantic and intelligent minefield. Accurate firing is essential, as each miss means that you get fewer points for the next robot you hit.

What I like about this game is that you get better and better: the first screens can be got through remarkably quickly, enabling you to reach the hard screens straight away. The graphics are good, and smooth. Sound effects are nicely done. The game loads fast, and the instructions are adequate. Overall, very good. **IC**

JUMPING JACK

Joystick or keyboard
Price £6.95

When a software house produces yet another version of an old arcade classic, I'm ready to yawn and award it a thumbs-down. Jumping Jack, however, is something different. By adding a sense of 3D perspective to the old favourite Frogger LiveWire has managed to improve on the original to the same extent as Zaxxon improved on Scramble.

Frogger, we probably all know: the player has the task of guiding a frog across a busy highway, followed by a swift-flowing river, avoiding perils such as cars and crocodiles. Jumping Jack has all the usual extras to be found in Frogger games – snakes, diving turtles, lady frogs, otters and dragonfly. There is also a two-player option. And as well as the good graphics, the authors have added some touches of class: there are nine levels of play to choose

from, and the player may define his/her own choice of keys to play – an option sadly lacking from many games on the market. Naturally, there is also a joystick option.

This game will be a treat for all fans of Frogger, and should also convert more people to being Frogger-fanatics. Jumping Jack is destined to become a best seller, and the definitive version of Frogger for the 64. **DW**

KAKTUS

Joystick or keyboard
Price £8.95

My first reaction was "what a load of rubbish"; but after a while the possibilities dawned on me. The mainstay of the program is the swarm of wasps and hornets (yes, I know hornets are wasps) homing towards the base of the cactus, where the tastiest morsels are located.

If you have been crass enough to let them reach ground level they chomp away at the stem and topple your home: and that's one life gone shagging. Show no mercy, pepper them with gunshot – after all they are excreting some pretty nasty stuff in your direction. Damn and blast! Nearly forget the mole, the swine掌在 phaguing up your doorway from one side of the screen to the other. Screen two: the buzzard, a bouncing bomb specialist, makes his entrance. Quite a lot going on now. Did I mention that you mustn't allow the wasp droppings to stroke away the soil?

Competent rather than state-of-the-art graphics and sound; but my first impressions were indeed way out. **LS**

Supersoft

OLYMPIC SKIER

Joystick only
Price £6.95

Great fun when played by a heavy of equally incompetent novices as there is plenty of scope for individual

ing pathetic performances. The après ski will certainly consist of hours of derision duly prompted by the program's assessment of bungling beginners' scores-loves.

The BBC's winter sports theme precludes the three-part test. Section one is a slalom run, with the mandatory timer; part two is a slingshot, a welcome change, and the last is an obstacle course, weaving between trees with logs and rocks to jump over. There is a helicopter standing by to carry casualties to the elastoplast shop also adding a splash of welcome colour.

Considering the limited scope, the graphics are fine, the sonics are mainly varying degrees of white noise relating to your speed. **LS**

Mr Chip

Presentation:	****

SPLAT!

Keyboard or joystick
Price £6.50

Whoopie! The SID chip virtually talks ... well, as near as damn it! The rest of the sonics are mundane but definitely full marks for the excitement. The graphics are run-of-the-mill too. Nevertheless the game is an ingenious, refreshing variation of the familiar maze situation, essentially the screen is a window on a large foraging area, with succulent tufts of grass and windmill plums waiting to be devoured: dangers lurk in the shape of spikes, unstoppable objects (ok when green or purple) and sheets of cyan water.

These are minor considerations however; the big splat maker is the patterned boundary surrounding the screen. As your window-on-the-world slips and slides around most unpredictably, and a trifle jerkily, there is always the imminent prospect of being sandwiched between maze and wall (good job the squelch is in place!).

Never a dull moment, in fact continued interest is ensured by the maze's aspect continually changing and the progressively in-

An independent chart to best-selling games, compiled by R.A.M./C. for Commodore User, representing retail sales in independent specialist outlets referenced against distributive sources

**"When I got it home, it was
nothing like the picture on the box."**

How often have you taken a new piece of software home to find it just didn't live up to the blurb on its box.

Wild, zany pictures, promises, promises... And the game play itself is one big let-down.

Well, those days are over.

Activision software is something else. What really sets it apart is the way you go on running it.

It stays on top of the charts months after others drop right out.

See the first titles in your usual Commodore software store now.

TOMMY'S TIPS

Tommy is Commodore User's resident know-all. Each month he burrows through a mountain of readers' mail and emerges with a handful of choice queries. The result, before you, is a wodge of priceless information and indispensable advice. There's even the odd useful tip as well.

Dear Tommy, Please can you tell me how I can print large and small letters on the screen at the same time? I ask this because recently you printed a program called Hieroglyphic and I could not print it into my computer.

Can you also tell me if the VIC-20 programs fit the Commodore 64?

I think you have got a little confused because the program was not listed on a Commodore primer; if it had been, the upper case C would have been printed as a horizontal line and the lower case c would have been as upper case C (that's not too confusing). When typing in the Hieroglyphic program type SHIFT C for line 5 and a normal C for line 6; likewise for the 6 in lines 2 and 8. As for getting both upper and lower case letters on the screen at the same time, just press the COM logo key and the shift key together. (The reason I know that the program was not listed on a C64 primer is that when using upper and lower case letters the program must be typed as lower case - typing in upper case using shift would have caused a SYNTAX ERROR when the program was run).

On your second query the answer is - a definite maybe! So long as there are no PEEKs, POKEs or machine code calls, VIC-20 programs should run on the 64 without any problems; the screen width may have to be adjusted though. The problem is if you already have them as tape is that you cannot load VIC-20 tapes into the 64, you have to re-type them in full (disk-based programs will transfer, however). If the program contains specific memory addresses then it might still be possible to convert them; if you know what the program is doing; it just involves a lot more work because you can type it in and run it.

DEAR TOMMY, I have a 64 on which I have written a number of statistical programs. While running this type of program it is impossible to avoid the possibility of having an overflow error during computation. Is it possible to recover from this type of error and why is the Basic program?

I'm afraid the simple answer to this is "no", at least not without going into machine code each time you do a calculation. There is not however some extensions to Basic that allow an "ON ERROR GOTO" command; this will allow you to trap such an error, the routine you jump to giving a warning and possibly reducing the scale of the number. David's Basic, as offer in the Deals for Readers section, features such a command.

Are you really sure that you need numbers that big though? Sometimes changing the order in which calculations are done can avoid such errors. The only other way is to test the computation in stages before carrying out each calculation. If the results of the previous stages are likely to cause an error when added or multiplied together then you could indicate an error yourself at that stage and avoid doing the next calculation.

DEAR TOMMY, Could you please explain the following odd effects I have discovered on my expanded VIC-202 to Direct Mode, POKE 4096 with any value from 0-255; then hit return and type LIST. Return. A corrupted LIST will appear even though the machine may only just have been switched on.

I have had a few problems entering a mix of Basic and machine code with the programs crashing as a result of the corrupted list.

My local Commodore shop (South Coast Computers) assures me it is an operating system fault built into the machine as their demo Vis and a new machine show the same effect.

The thing I fail to understand is why on earth you should want to POKE

4096 with any value at all? This address is right at the start of the Basic program area, so what you are doing when you change the value is to corrupt (or set) the line link pointers which are at the start of every line; in other words you have set up a false pointer to the next line in Basic. The result, unless you happen to POKE exactly the right value, is a corrupt list - because from then on all the other 'pointers' will be wrong, since the address pointed to will no longer be the start of the next line but part of the program.

If you are using a Basic/machine code mix, be very careful where you store your machine code. It is extremely important that you reserve a space in memory by changing the 'top' (or bottom) of memory pointers so that the two parts of the programs do not overwrite each other.

DEAR TOMMY, I have a query relating to the unusability of a 64 program on a VIC-20. I recently purchased a 64K RAM pack which I presumed would allow me to use programs for a 64 on my VIC. I was greatly disappointed to find that hardly any of the programs worked. Can you tell me why? and how can I get such programs to work?

Unfortunately, buying a 64 RAM pack does not give you the facilities or even the same memory as a C64. Most 64K RAM packs are split into eight 8K blocks, only some of which can be accessed at any one time. You can normally select which blocks you wish to access directly, but the rest of the RAM is 'hidden' from the memory map (although the contents of all 64K is maintained while the power is on). Unfortunately the memory map of the Vic cannot be altered to give more than an extra 32K available to Basic. As if that were not enough, the sound facilities are totally different; the sprites do not exist on the Vic and any PEEKs or POKEs will need to be changed as well. The result is that no matter how hard you try you will never manage to make a Vic act exactly like a 64. Having said that, there is

no reason why a program written for the 64 in standard Commodore Basic will not run on the Vic, but only if it doesn't use any of the facilities that make the 64 a better machine. If anyone tells you that adding a 64K cartridge to the Vic will turn it into a C64 then I suggest you go and find some of that salt you have left over from the winter!

DEAR TOMMY, I have a Vic with VIC + 8K + 16K and I want to see the 32K block for redefined characters. In Butterfield's series Visiting the Vic video chip he said somewhere: "The VIC-chip can only see the lowest 8K of RAM (block 0 to 15)". In an advertisement for a 27K expansion you can read: "With 8K or more activated the 32K block can be used to hold redefined characters..."

The 32K block is ideal for this; but my problem is how do I make the VIC chip see block 8 to 15?

I tried to copy 32K of the character set down from ROM, and when PEEKing I found them all there. Not when I told the Vic where to find the characters by POKEING 36800,281 (block 9) I got only garbage on the screen. Can you help?

I'm afraid the advertisements are somewhat misleading; you cannot store the character set in any expansion memory area, only in the permanent RAM that comes with the Vic (4096-7399). It is this area that is referred to as blocks 8-15; blocks 0-11 are therefore memory addresses 4008-5332 and have nothing to do with the 'lower 32K RAM area' which occupies memory between 1024 and 4096.

When you have 8K or more expansion RAM fitted, what you have to do is raise the start of Basic to 1644, and put your redefined character set in the 1024 bytes between 5120 and 6143. To alter the character set location you will need to type POKE 36800,PEEK(36800) OR 12; this ensures you do not change the screen location which is determined by the same register.

Letters

Write away

This is your page: normally we write for you, but here we listen. Feel free to let us know what you think - about the magazine, about Commodore, about suppliers, about life, art, the meaning of existence or whatever. We don't print everything we receive, of course; but anything that might be of specific relevance or general interest will make it to these pages.

New York, New York

For three months now, copies of your magazine have been available on Newsstands here in New York.

One reason I spend more time with Commodore User than I do with American mags is the superiority in your publication's content. American magazines seem to concentrate mostly on type-in games. These are a waste of time - they take forever to type in and they're dull and suffer from the small's speed of Basic. Your magazine seems much more devoted to programming tips, useful utilities, and thorough product news and reviews. American magazines are much thicker than yours, and a little more polished, but style is no substitute for content. One tip you might take from them concerns program listings. All American Commodore magazines have some sort of symbolic system to substitute for the graphics characters that are generated by cursor and color controls to make them more legible. Also, some magazines have special ASCII checksum proofreaders that work line by line to help in debugging. It's also interesting to note that Jim Bumbeard is looked upon as Commodore Guru in your country as well.

As far as the product market between our two countries, there's a big difference. Hardware is simply cheaper here. The 64, 41, 801, 1528, and 1702 all sell for about \$2000 give or take \$20 at good discount stores in the city. (This is probably the cheapest price in the world for all sorts of electronics!) The SX-64 can be had for about \$600 if you know where to look. Commodore has gone the mass-merchandising route here, and as such has caused a sort of mummy by its authorized dealers, something CBM's new

chairman has on the top of his list to amend. Commodore seems to have a much better set up in the U.K. than here. Most of the bungling that they perform so well can be blamed on their U.S. set up. This show that they're having in London would never be done here (In Canada yes, but not here).

Commodore's software is also cheaper here. I bought Easy Script for \$34, Simons' BASIC for \$28, and their assembler for \$17. It's funny, in terms of software, Commodore does not offer all their American product to you, nor their British product to us. As far as other software goes, I've noticed thus 1) You have almost no American software, 2) We have little British stuff, 3) Ours look much better, and 4) You are Cassette worshippers. About 2% of our software is on cassette 10%-20% on cartridge, and the rest is on disk. The datasets is a cruel and unusual form of torture, and here the disk drives are fairly cheap, so they're popular.

I've read that 90% of all 64 owners have a drive. Do you know that there was a period of 2-3 months when you couldn't buy a 1541 in this entire country? Commodore ran out, they never expected such a high demand. By the way, nothing is sold in a package with software here, most people don't consider it a bargain, because, to be honest, a lot of piracy goes on. One thing about cassette games, they're cheaper. Most disk games are about \$35.

Keep up the good work.

Andrew J. Brast, 308 West 4th Street, New York, NY 10014, USA.

View from New Zealand

The Vic and 64 are well known now in New Zealand, but the problem for the Vic owner is that it is treated by the dealers as not much more than a games machine, surprising since the cost is around \$400 (NZ) compared with about \$1000 (NZ) for the 64. To expand the Vic by 16K is around \$150 (NZ), so it is easy to understand why not many people bother when the software

available for serious use is just not available.

It would be nice to know that someone out there is thinking of us and trying to develop software which would fully utilize the capabilities of Vic in such fields as Education and perhaps I see at Commodore UK a glimmer of hope in Gail Wellington's outfit (Reviewed in the February edition).

What can your magazine do? Perhaps you could find out what people are using the Vic for in the areas of education, interfacing with measuring instruments, modular programming, anything out of the ordinary in fact. Perhaps also you could find out what ideas people have for uses of Vic and put some pressure on the software producers - they are not going to produce anything unless they know it is in demand.

Geoff Fisher, 15 Loynham Road, Flaxhatten, Upper Hutt, New Zealand.

Praiseworthy

Through your columns I would like to praise AAC Software 51, Ashtree Road, West Midlands.

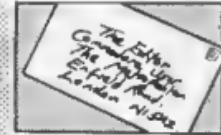

I purchased for my Vic 20, a Data program and a Vicset word processor. Later I bought a 1520 printer plotter thinking that I could use the programs with the printer, which it wouldn't. I wrote to AAC asking them to alter my programs, if possible to print on the 1520. Within two days they sent me 2 new programs to run on the 1520 and kindly asked me to return the original tapes to them. What trust, what service and no charge!

I would like publicly to thank them in your magazine.

Mr V. Lawton, 29 Ivy Green Drive, Springfield, Nr. Oldham, Lancs OL4 4PR.

Return to Beaver

Through your 'Deals For Readers' section I purchased an 'Intrigue Data Base Program' to assist me with amateur radio operators' call signs and locations throughout the world using my CBM 64.

Upon receiving the tape I spent a whole day trying to make it run. Alas! No such luck! I returned the tape to 'Beaver Software' and the evening after posting received a telephone call from 'Beaver' at home. The simple fact of the matter was that I had not read the instructions correctly and when the program was explained to me I felt very silly.

The gentleman from Beaver on the other end of the telephone could not have been more helpful.

The object of this letter is to illustrate that magnificient after sales service still exists, and this is reflected in the superb attitude of Beaver Systems'.

Top marks to Beaver for a splendid PR exercise. No Prizes for guessing who has secured a customer for life.

Bernard Deans, 4 Deanbank Street, Dundee, DD2 2EA.

Cold storf

I would like to tell you about the first club in Iceland for Commodore owners specifically Vic-20 and C-64. The club started last October and now is about 130 members in the club. We have published 4 newsletters and are working on the 5th. We would be very glad if you could put our name and address in your paper so other Commodore owners will know of us here in Iceland.

SYNTAX Newsletter, c/o Gudmundur Gislasson, Blakkarholt 4, 125 Esbifjörður, ICELAND.

Camel POKE

To prolong 'Attack of the Mutant Camel' add line 0 POKE 11639, 255 after loading the first Coaster program, then RUN

Hope this is of interest (Autodromo's 'Motor Mania' can be altered with POKE 8648, 255 after loading; I think this is a less popular program though).

Roots West, 4 Highview,
Melford Road, Hampshire,
London NW3 1AT

Help for handicapped

We are in the process of establishing a database of software for the handicapped — BARDOSOFT Easify, each entry in the database will contain a description of the programs, the handicaps they are suitable for, the type of computer system required, name and address of supplier/developer and price, etc. This information will be made available through printouts in answer to specific enquiries.

The aim of BARDOSOFT will be to facilitate the exchange of information on software relevant to any aspect of the lives of handicapped people. One major addition will be the concerned effort to promote the

database, and therefore the software, abroad. This is what we have been doing successfully for non-software products in the field.

As we are currently collecting and processing information, we would be pleased to hear from any of your readership who may wish to contribute to BARDOSOFT. For further information please contact me at the address below.

Peter Curran, Handicapped Persons Research Unit,
Newcastle upon Tyne Polytechnic, No.1 Conck Lane,
Coach Lane Campus,
Newcastle upon Tyne NE1 2TZ.

Commodore resolve

I would like to thank you for publishing my letter in the April 1984 issue of Commodore User, as a result of this Commodore have been in contact with me and resolved my complaint.

The response which I had from your readers was overwhelming, how pleasant it was to receive so many helpful and friendly letters. I

have not replied to all the letters yet but I will do so.

If you have tucked away in some corner a listing for a 'DIR' sorter for the 1541 disk drive please consider publishing same as I am sure many of your readers would find it useful, and I would.

Many thanks for a friendly and informative magazine.

Derek Rawnsley, 9 Saltersgate Road, Meesingham, Scunthorpe, South Humberside DN17 3SZ.

Can someone help?

I was in London fifteen days ago and, at the Pilot Software City, I bought — for 28.70 LGS — the Commodore VICFILE.

Back in Milan, I tested the program, which loads with some strange noise in the drive, and everything seemed to run very well and, I must say, that was exactly what I had in mind to buy.

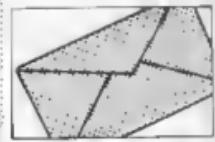

Unluckily, what I cannot get to run, is the most powerful part of the program, the Specify Search and Search File (what of course I dis-

covered after many hours of inserting items...).

Let me explain: after creating my format, inserting data (about 100 records with 20 fields each), I used the Specify Search program, selecting two of the fields and everything, again, seemed to run normally, but when I went to the Search File Option, I got an Error 38, what means that no search file was created.

It's clear that I tried and I checked everything many times before writing you. By using the Directory through Disk Utilities, I was able to see that my Search File was present in the Directory.

Moreover I tried to copy the Search File to another diskette and, once, it worked. The attempt to re-copy to the first diskette (after

Introducing

MusiCalc™

The Creative Music System

MAKE MUSIC PLAY On Your Commodore 64™

Put the MusiCalc™ diskette into your Commodore 64. Sit down. And brace yourself.

You're about to discover an entirely new way to make music. With MusiCalc, the creative music system that makes music play. Almost instantly, the whole family will be able to create and perform all kinds of music. From rock 'n' roll to technopop, from classical to country western.

MusiCalc makes music more fun, more rewarding and easier than it's ever been before.

NOTEWORTHY SOFTWARE

MusiCalc software turns your Commodore 64 computer with disk drive into a sophisticated musical instrument. And it turns you into a composer, performer and conductor.

MusiCalc's Synthesizer & Sequencer is the heart of the system. With it

you can use your computer keyboard to program the tempo, key

and style of music you want, and also to play your favorite tune. The computer screen will show you what the music's doing as you play and how to control it.

Start by selecting one of MusiCalc's preset scores. Try combining that with a preset sound you like. Choose the scale you want to play in—anything from jazz to Japanese.

Presto! You've got music.

Exercise your musical creativity by putting the three voices together any way you want, and playing whatever parts you'd like. Make changes and add special flourishes to create your own compositions.

Even a musical novice will sound good right away. And the greater your musical talent, the more challenging and exciting MusiCalc becomes.

BACH TO BASICS

Although simple to learn, MusiCalc was designed to meet the needs of professional musicians.

In fact, it delivers the quality and capabilities professionals have spent thousands of dollars for—up until now. Once you have the Commodore 64 computer and disk drive, you can get started for under \$100 with the MusiCalc 1 Synthesizer & Sequencer.

This is a standalone software program you'll never outgrow. And with the variety of other MusiCalc products currently available, plus the many more items Waveform will be introducing in the months ahead, you can expand your music system along with your interest and ability.

THE MUSICALC SYSTEM

MusiCalc includes a full line of software that brings great music as close as the keypad of your Commodore 64. MUSICALC 1, Synthesizer & Sequencer Turns the Commodore 64 into a sophisticated musical instrument—a three-voice synthesizer and fully-interactive step sequencer. Play along with a song or write your own. Develop your own instrument sounds. And record the music you create.

MUSICALC 2 ScoreWriter™ Works with the Synthesizer & Sequencer to change your musical improvisations into musical notation. With the addition of an optional graphics printer you can turn your

own original compositions into sheet music. Requires MusiCalc 1 to operate. **MUSICALC 3, Keyboard Maker** Enables you to create your own custom musical keyboards. Comes with over 30 preset keyboard scales from around the world—everything from classical to rock. Requires MusiCalc 1 to operate. **MUSICALC TEMPLATE 1, African and Latin Rhythms** Add this to the MusiCalc 1 system and it provides additional musical scores and patches you can play along with or use to develop your own compositions. Requires MusiCalc 1 to operate.

MUSICALC TEMPLATE 2, New Wave and Rock Works like Template 1 and features the latest Technopop scores and sounds. Requires MusiCalc 1 to operate.

MUSICALC PROFESSIONAL SYSTEM

The MuSiCalc, Synthesizer & Sequencer, ScoreWriter, and Keyboard Maker, plus the two Templates, in one cost-saving package.

HIT DISKS Recordings to play on your computer. Original Technopop compositions, current hits and old standards performed by the Waveform Band. Ask your dealer about current releases.

COLORTONE KEYBOARD AND MUSICALC 4 A totally new concept in keyboards, ideal for everyone from novice to professional. A professional quality keyboard that's remarkably easy to learn how to use. The keyboard comes with special software that allows it to work with MusiCalc 1 and 2, enabling you to play music on the keyboard and record it on disk to play back or print out later. Add MusiCalc 4 and play any scale in any key, for even greater musical capability. Available soon.

YOU can go for gold

...with the **MICRO** **OLYMPICS**

Now on the
48K Spectrum
and Commodore 64

Fancy pitting yourself against the world's best at this summer's Olympics?

You can do so without going anywhere near Los Angeles - with the most challenging package of programs of 1984.

MICRO OLYMPICS is more than a game. It's a brilliantly written collection of ELEVEN track and field events.

And because we know we're going to sell many thousands of them we've brought the price right down - to just £5.95.

Ever imagined yourself as another Steve Cram? Then try to run against the world record holder at 1500 metres. And if that distance is too much for you then there's always the 100, 200, 400 and 800 metres to have a go at.

Not much good at running? Don't worry, **MICRO OLYMPICS** has many more challenges for you. Why not try your skill at the high jump or the long jump?

And if you can't beat the computer at running or jumping then you can always throw things around in frustration! The trouble is that it's just as hard to be a champion at the discus, the hammer or the javelin.

And the pole vault takes the event to new heights!

Yes, it's fast, furious fun, pitting yourself against the world's best times and distances on your micro.

You may not be another Steve Ovett or Alan Wells, but with practice you COULD become the Micro Olympics Champion!

Also available from WH Smith
and all other leading stores

scratching the original file) didn't work and any other attempt to do again what had worked the first time, was a failure.

It's also clear that I repeated my test with new diskettes and new Format and Records, just to confirm to see this Error 36, which was at least 90% of my interest in the rest of the program. Can you help me somehow? Or can maybe some other VIC-20 owner help? Apart of that, best compliments for your mag.

Sciaro Casanova, 20021
Milano (Milano), Via Coma, 31-
31, Italy.

Complaints dept.

I bought a copy of your June issue at the strength of two articles. Both

promised to be most informative.

The articles concerned were "Butterfield on Video" and "All about Wedges". The first was excellent, well written and with a sound teaching method. The second came as a bit of a strain. Either it is amazingly badly written or a major part is missing. It would appear that the article has intentionally or unintentionally been truncated to make way for the next page's advert. This seems a bit strong in a magazine where adverts exceed all else by seven pages and where reviews of manufacturers' products account for about 40% of the remainder. Hardly editorial endeavour at its best.

Your magazine has all the makings of a superb publication, and it is a great disappointment to think that the ragged amateurish approach which characterises so many other bashed-up efforts, called magazines, is creeping into your domain.

I register my protest.

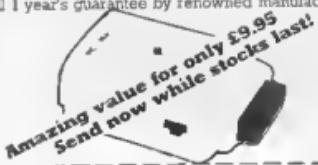

M.J. Rutter, 36 Westpoint,
Newick, Lewes, Sussex BN8
4NU.

CASSETTE INTERFACE FOR YOUR CBM 64/VIC 20

Use your own portable cassette recorder with your Commodore 64 or Vic 20 computer.

LOOK AT THESE FEATURES:

- Extremely reliable — one of the few cassette interfaces to actually work!
- Full remote motor control
- LED indicator for precise volume setting — no more trial and error recording!
- High quality plastic casing
- Supplied complete with leads, connectors and full instructions
- Full 1 year's guarantee by renowned manufacturer

Now available on the Commodore 64

New features include instrument landing system, engine sound, full colour and 100% m/c.

747 Flight Simulator

Actual screen photo (BBC version)

Much-praised for its accuracy and realism, the DACC 747 Flight Simulator is unrivaled and unbeatable. Professional Jumbo-jet pilots say the flight deck layout is tritely recognizable as that of the 747 the world's most impressive airliner. With attention given to every detail DACC have combined 17 years computer expertise with a wealth of knowledge of aircraft to produce a realistic simulation on a home computer system. Features include: full four-engine instrumentation. Many other indicators and warning lights are provided together with the sound and the precise 3-D view of the runway seen through the cockpit window. Machine-code and high resolution graphics make the 747 Flight Simulator a thrilling experience not to be missed.

Can also be used with or without joystick. Also available on BBC/B, Electron, Dragon, Tandy C/C and Atari (48K). Dealer enquiries — Phone (0942) 57872.

A new age has dawned

with the

STACK LIGHT PEN

It's a new, easier way to creative software and it's fun too! The Stack Light Pen means freedom from the old labours of the keyboard and a new software style for the future.

Using the Light Pen means you can create programs including games, with that extra dimension - control at the touch of the pen. With your Light Pen you can remove words or images from the screen or put them back onto it, or simply move them about the screen. You can even trigger off a series of actions on screen stopping them at will - with the touch of the Light Pen!

And it's so easy to use - simply hold it against the screen, touch the contacts and away you go!

LIGHT PEN SOFTWARE

We've already created software for you to use with your Stack Light Pen...

DRAUGHTS GO LIFE & ROSSWORLD TWISTER SIMON OTHELLO SEEK & DESTROY SHUFFLER LOST IN THE LABYRINTH and there's more on the way!

STACK LIGHT PENS and SOFTWARE are available from your

STACK COMPUTER SERVICES LTD. 290-298 Derby Road, Bootle, Merseyside L20 8LN
(24 hrs) Telephone 051-833 5511. Telex 627026 (Stack G).
